**Putting nitrogen fixation to work  
for smallholder farmers in Africa**

N2Africa is a project funded by The Bill & Melinda Gates Foundation by a grant to Plant Production Systems, Wageningen University who lead the project together with IITA, ILRI, University of Zimbabwe and many partners in the Democratic Republic of Congo, Ethiopia, Ghana, Kenya, Malawi, Mozambique, Nigeria, Rwanda, Tanzania, Uganda and Zimbabwe.

## List of abbreviations and definitions

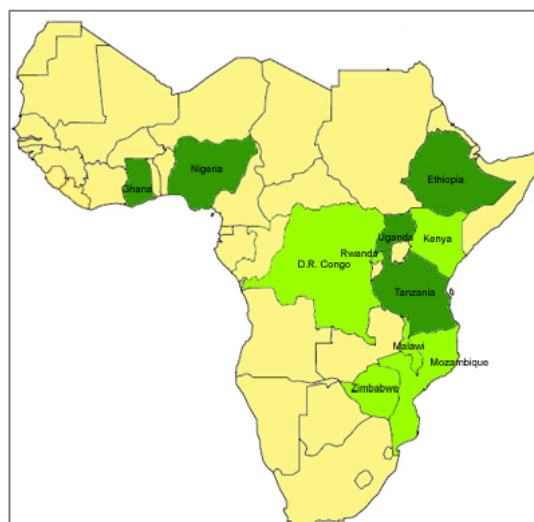

| Word   | Acronym | Definition   |
|--|---------|--|
| Buyer model  |         | Business model that aims to increase quantity and/or quality of crop sales, also known as contract farming.  |
| Cooperative-Collaboration Agreement                              | (ca)    | Agreements made by consenting organizations to share resources to accomplish a mutual goal.  |
| Grant Agreement  | (ga)    | Agreements made between organisations where money or something of value is transferred from one organisation to the other to accomplish a mutual goal  |
| Information linkage model  |         | Business model that involves brokering information between actors  |
| Input & Information model  |         | Business model that aims at brokering general value chain information and input sales (demand quantification)  |
| Input supplier model   |         | Business model that aims to increase input sales.  |
| Material Transfer  | (mt)    | Agreements made where organisations agree to the transfer of tangible research material for their individual research purposes.  |
| Memorandum of Understanding                                      | (MOU)   | An agreement between two or more parties, indicating an intended common line of action. It is often used in cases where parties either do not imply a legal commitment or in situations where the parties cannot create a legally enforceable agreement. |
| Micro-entrepreneur model   |         | Business model that aims to generate income from input and service sales.  |
| Nucleus farm model   |         | Business model that aims to group of farms to generate income.   |
| Producer collective model  |         | Business model that involves producer groups driving access to inputs, services by members   |
| Sub-Contract Agreement   | (s)     | Agreements made between organisations where the sub-contracted organisation undertakes activities on the behalf of the other.  |
| Sub-Contract Agreement under Cooperative-Collaboration Agreement | (sca)   | Agreements where the Lead partner or other partner of the Cooperative-Collaboration Agreement is subcontracted based on expanded scope of work or extra expertise.   |

## N2Africa at a glance

N2Africa is a large scale, science-based “research-in-development” project focused on putting nitrogen fixation to work for smallholder farmers growing legume crops in Africa. The project is funded by The Bill & Melinda Gates Foundation by a grant to Wageningen University & Research who lead the project together with IITA, ILRI, University of Zimbabwe and many partners in all N2Africa countries.

N2Africa aims to contribute to increasing biological nitrogen fixation (BNF) and the productivity of grain legumes among African smallholder farmers; in turn this helps to enhance soil fertility, improve household nutrition, and increase the income of smallholder farmers.

N2Africa Core countries (dark green), Tier 1 countries (light green).

Our vision of success is to build sustainable, long-term partnerships to enable African smallholder farmers to benefit from symbiotic N<sub>2</sub>-fixation by grain legumes through effective production technologies, including inoculants and fertilizers. N2Africa links scientific knowledge with capacity building and public-private partnerships.

The project is designed to ensure that the benefits of grain legumes are impacting positively on rural livelihoods and their production environment. The initial set of countries (e.g. Ghana, Nigeria, DR Congo, Rwanda, Kenya, Malawi, and Zimbabwe) covered a critical range of agro-ecologies with varying farming systems and priority legumes, providing an excellent framework for evaluating the diversity of legumes and their benefits. During the first project phase (2009-2013), activities in the initial Tier 1 countries focussed on research activities in relation to legume agronomy, cropping system design and rhizobiology and generating interest from the first generation of dissemination partners. During the second phase, the project expanded to a second set of countries, the so-called Core countries (e.g. Ethiopia, Ghana, Nigeria, Tanzania and Uganda). The Tier 1 countries have lower targets than the Core countries.

N2Africa has progressively evolved and adapted from a role of direct implementation to a role of catalyst and knowledge provider. During the early years N2Africa staff were responsible for design and implementation of activities through sub-contracting of local development and research organizations. N2Africa is now a well-known, well-respected and much sought after partner for development partners and private companies as a key knowledge provider concerning diversification and intensification of smallholder farming through legume-based technologies. The flexibility of the major grain legumes in terms of growth habit and duration, seed types and their multi-purpose nature (for food, nutrition, sale, fodder and soil fertility) provides benefits for all farmers from the poorest to the wealthier across agro-ecologies. Farmers enthusiasm is repeatedly expressed through their desire to cease small-scale demonstrations and move to large scale implementation. Barriers faced often occur at the institutional level – in terms of ensuring last-mile delivery and consolidation of produce to ensure marketing at favourable prices. The strong investment in public-private partnerships is yielding promising results in upscaling of technologies and will ensure continuity in the future.

The N2Africa Annual Report 2016 presents the results and progress made against the five project objectives in the eleven countries in 2016. The N2Africa Annual Report 2016 also provides insights in country specific challenges, risks and opportunities. The narrative report provides more detailed information behind the numbers presented in Table 19.

## Major achievements

- **CAPACITY STRENGTHENING TO SUSTAIN DELIVERY:** Capacity building activities focused on both partner staff and value chain actors. In 2016, a total of 24,172 persons were trained, with a female participation of 47%. In total, 32,717 persons were trained from 2014-2016, way beyond the project targets. About 74% of the total persons trained were reached by trainings conducted by partner staff. Training topics cut across the whole legume value chain (e.g. execution of dissemination trials, postharvest practices, data collection using tablets, seed production, handling and application of inoculants, herbicides, market standards, gross margin calculations, business plan development, marketing and legume value addition). The project supported 50 students at MSc and PhD level, with a female participation of 36%.
- **ENTRY STEP FOR ADOPTION OF TECHNOLOGIES:** In 2016, a total of 117,313 farmers were reached (49% female) through various dissemination approaches. In total, 374,717 farmers were reached up to 2016. This number exceeded the target (253,750 farmers) by 148%. Key among the dissemination approaches are demonstrations, adaptations, field days, media events, and video shows. These approaches have been adjusted in some countries to include partner feedback and implementation strategies (e.g. expanding area of demonstration to accommodate more farmers and including new farmers around adaptation plots). In total, 1,685 demonstrations and 34,897 adaptation trials were established in 2016 across all countries. The majority of households (41%) were reached through demonstration trials, followed by field days and agricultural shows (34%).
- **LAST MILE DELIVERY OF INPUTS:** Stimulating access to inputs by farmers was a priority across all countries in 2016. Across the countries farmers express the desire to move beyond demonstrations, demanding access to the technologies. At project level, 59% of the 2016 target (3,045 tons year<sup>-1</sup>) of volume of seed used by farmers was achieved. With regards to inoculants and fertilizers, the project achieved an increase of 47% and 147%, respectively, as compared with 2015. About 61% of volume of inoculant target (25 tons year<sup>-1</sup>) and 31% of the volume of fertilizer target (5,075 tons year<sup>-1</sup>) were achieved. In Nigeria, N2Africa facilitated Intrio Synergy Limited, for example, to market inoculants to soyabean farmers. Inoculants were imported and/or produced in all countries and many new products have gained official registration for sale.
- **DEMONSTRATED OUTPUT MARKETS OPPORTUNITIES:** Collective marketing and value addition is a key topic, stimulating access to profitable markets and consumption of legumes for improved nutritional status. Up to 2016, a total of 119,690 persons (49% female) were involved in collective marketing and value addition activities, achieving 96% of the target. Value addition activities were mainly related to soyabean and groundnuts and resulted in various high value products, such as soyabean flour, beverages, blend of soyabean flour and other cereals, soyabean cake, groundnut oil and cake. Collective marketing activities were mostly done through bulking by cooperatives.
- **ENTRY POINT TO REDUCE DRUDGERY:** In 2016, 16,035 farmers used labour saving tools. About 63% of the 2016 set target (25,375 farmers) was achieved.

Herbicide use was the most frequent approach to saving labour (e.g. 80%). Other tools included threshers, groundnut shellers and planters.

- **EVIDENCE FROM AGRONOMIC RESEARCH:** A major aim of N2Africa is to provide a basket of technology options suitable for both wealthier farmers who are able to invest in producing for the market and to improve the nutritional security of poorer farmers. Technology recommendations for different agro-ecologies were made based on their agronomic performance and social factors. For example, by analysing more than 2,000 trials across ten countries and five years, we could evaluate the overall benefits of rhizobial inoculants with soybean, as well as patterns of variation in response. The analysis showed that with an average yield increase of 115 kg ha<sup>-1</sup>, inoculation is economically beneficial in 97% of cases. In an Ethiopian multi-site, multi-year evaluation, inoculation was shown to increase yields by an average of 400 kg ha<sup>-1</sup>, while the combined effect of inoculant and phosphorus was 600 kg ha<sup>-1</sup>. A key learning is that the additional yield obtained through combined use of inoculant and P fertilizer results in strong economic returns to the fertilizer, whereas P fertilizer alone is often barely profitable. A diagnostic study in Ghana showed that soil fertility parameters, particularly those related to soil phosphorus and silt content, were found to be the most influential variables affecting soyabean yield.

Analysis of yields from N2Africa focal adaptation plots and corresponding farmer's main fields showed that N2Africa technologies resulted in increased yields. The relative increase ranged from 13% to 138% across the countries for N2Africa plots compared with the control. Cowpea yield on the N2Africa plots in Tanzania yielded 138% as compared to the control plots, groundnut yield 61% more in Ghana and climbing bean 13% more in Uganda. The focus for 2017 will be to interpret and document best bet-technologies based on meta-analyses of agronomic data and advance the most promising technologies to ensure their availability to farmers through dissemination activities.

- **QUALITY CONTROL OF INOCULANTS:** Inoculant quality control is carried out in ten N2Africa countries. N2Africa supported government institutions, such as Sokoine University of Agriculture in Tanzania and Mozambique Agricultural Research Institute (IIAM) in Mozambique, with equipment for inoculant quality control. Results of quality control tests of LegumeFix stored by agrodealers in Nigeria showed that the inoculant packages contained both high density of rhizobia and no detectable contaminants. However, a large proportion of the packages were physically weakened by scratches due to handling emphasising the need for better training in handling to keep boxes sealed prior to use. Quality control tests by MIRCEN laboratory, Kenya indicated that both BioFix and NoduMax contained adequate numbers of rhizobia. However, the degree of contamination in BioFix inoculants is of concern as this means that the effective shelf-life may be too short. By contrast, NoduMax contained no detectable contaminants. Currently Ghana is compiling data to aid registration of NoduMax as the second inoculant brand in the country after LegumeFix.
- **PUBLIC-PRIVATE PARTNERSHIPS AS SPRINGBOARD FOR MASSIVE DISSEMINATION:** Up to 2016, 90 partnerships were formally signed with partners, such as agricultural research institutes, universities, local governments, private input suppliers, legume buyers, processors and development partners. The number of signed partnerships increased by 11% in relation to 2015 results and 97% of the 2015 partnerships were consolidated in 2016. Also, work plans were expanded to accommodate more results areas. The partnerships mainly cover dissemination, input and output markets, capacity building, and research. Dissemination and

output markets are addressed by 79% and 66%, respectively of the partnerships. Whereas input supply is covered by 62%. In addition to the partnerships, other national, regional, and district stakeholder platforms are used to address issues, such as coordination and policy issues within legume value chains.

The Producer Collective model and the Buyer model were the most frequently used models in partnership agreements, 43% and 18%, respectively. The Producer Collective model, which focuses on building farmer organisations, was used in all countries except in Nigeria and Zimbabwe. The Buyer Driven model is essentially contract farming. Both models link farmers to input and output markets. In Tanzania, for example, Catholic Relief Services through the Soy-ni-Pesa project organized 410 producer groups with 9,477 farmers (38% female) and facilitated the bulking of soyabean. Tanzanian partners, BRITEN and Faida MaLi, reached many farmers through training on legume marketing and direct linkages to buyers. In Rwanda 3,732 farmers were involved in collective marketing through interventions done by CARITAS, Conseil Consultatif des Femmes and Developpement Rural Durable. In 2016, the volume of legumes sold increased substantially in some countries (e.g. in Kenya the volume of soyabean sold increased by 57%).

## **Innovation and systematic change towards achieving impact at scale**

- **LEVERAGING IMPACT THROUGH PARTNERSHIPS:** In total, US\$122.42 million was leveraged by N2Africa: over \$117 million through partner shared budgets directly related to dissemination of N2Africa technologies; \$4.6 million realized as new grants (e.g. Scaling up improved Legume Technologies (SILT) (IDRC), Gender and the Legume Alliance (GALA) (UK Aid), AGRA-SSTP (Scaling Seeds and Technologies Project - USAID), \$820,000 from sub-contract agreements with IITA-Support to Agricultural Research for Development of Strategic Crops in Africa (SARD-SC) Maize/Soya (Africa Development Bank (AfDB)), Women for Women International (WfWI), World Vision International and ZOA International.
- **EXPANDING PARTNERS AND AREA OF COVERAGE:** All countries exceeded targets of the number of farmers to be reached in 2016, yet the rate of increase slowed compared with previous years. Dissemination approaches, such as the ICT platforms developed together through new partnerships (e.g. GALA, SILT, Farm Radio International in Tanzania, M'Omulimisa in Uganda) will be explored further and adopted in other countries. We are confident N2Africa will meet targets the remainder of the project. Further effort is needed to consolidate use of labour saving tools to reduce drudgery in dissemination activities. One promising example is the Spray Service Providers Network established in Borno State in partnership with CropLife. The plan for 2017 is to scale up the use of other labour saving tools using the Service Delivery model.
- **STIMULATING PRIVATE SECTOR PARTICIPATION FOR INPUT DELIVERY:** The biggest challenge for scaling up remains the lack of infrastructure and an enabling environment to allow private sector participation which limits the capacity for last mile delivery and marketing. Key interventions such as registration of inoculants in all countries, input demand quantification (e.g. by BRITEN in Tanzania) and integration of inputs in government input subsidy programs (e.g. Anchor Borrowers Program in Nigeria) contributed greatly to the increase in input use. In 2017, we will address issues pertaining to last mile delivery (e.g. inoculants, herbicides) high prices, Certified and Quality Declared Seed availability, limited shelf life of inoculants (which hinders agro-dealer sales) and the risk of contamination due to

sharing of inoculant among farmers of packaged in large size sachets. A very promising sign is the increase in the number of private inoculant companies seeking registration and actively marketing their products across the N2Africa countries.

- **LINKING FARMER GROUPS TO ACCESS OUTPUT MARKETS:** In 2016, various output market models were integrated and/or reinforced in the partnership implementation plans across all countries. However, the project target for 2016 is yet to be met. The focus for 2017 will be to integrate specific interventions, such as building organizational capacity of farmer groups to meet market requirements and addressing country specific output market issues (e.g. policy implications, market requirements, and organizational capacity of farmer groups and modes of aggregation). Furthermore, it will be prudent to focus attention on output market specific partners (such as BRITEN and FAIDA MaLi in Tanzania) to ensure market identification, requirements, and negotiations for farmer groups within partnerships.
- **STRATEGY FOR MEASURING IMPACT**
  - **SYSTEMATIC STEERING AND LEARNING LOOPS:** Further advances were made in the Monitoring, Evaluation and Learning System over the past year. We are rapidly moving to having all data available digitally on the N2Africa online dashboard with quality of uploaded data cross checked by country teams. Available information includes all M&E data which can be aggregated at the partner or country level, farmer feedback on technologies, and results of agronomy trials. A select set of key indicators is calculated automatically on the dashboard. Obtaining data from some partners in a timely manner remains a challenge. The focus for 2017 will be on reviewing the M&E strategies of specific partners based on feedback generated in 2016.
  - **ICT FOR TIMELY LEARNING:** The functionality of the online dashboard will be expanded for both analysis of agronomy and M&E and made available for use by all stakeholders in 2017.
  - **LONG TERM PROJECT LEARNING:** The Early Impact Study conducted in 2013 and further analysed in 2016 provided a comparison across eight N2Africa countries. The findings were used to evaluate N2Africa's impact, to draw lessons learned and to provide recommendations for future improvement. The coming two years of the project will be used to design and implement a range of studies using quantitative and qualitative methods to examine the impact of N2Africa and maximize our learning.
  - **POLICY OPPORTUNITIES FOR OUTSCALING LEGUME TECHNOLOGIES:** The 'N2Africa Review of National Policies Relating to Legume Intensification in N2Africa Countries' showed that some governments acknowledge the importance of legume intensification and its significant potential to contribute to improving food security and health, especially for poor families. While many policies indicate the aim of boosting production of legumes, they are surprisingly silent on specific actions and interventions as to how this might be achieved. The study is being completed and will be used to provide recommendations to governments about best-fit legume technologies, how to increase production and productivity of various legumes and how to stimulate farmers' uptake and use of relevant technologies.

- **EXIT STRATEGY:** Public Private Partnerships are an important component of the N2Africa exit strategy. We are currently consolidating final exit strategy plans for the Tier 1 countries which are in the final year of funding. Strengthening existing partnerships (e.g. in the areas of partner relationships, modes of delivery and models of input/output markets) will ensure sustained delivery. The focus for 2017 will be to document processes to identify what is working well that can be replicated and what is not working well that needs to be corrected or avoided within the partnerships.

## 1 Progress narrative

The N2Africa Annual Report 2016 presents the results and progress made in reaching the N2Africa Vision of Success. Results and progress are evaluated against the five project objectives in the eleven countries, which are:

1. Project strategy, coordination and implementation, and capacity strengthening;
2. Delivery and dissemination, sustainable input supply and market access;
3. Empower women to increase benefits from legume production;
4. Tailor and adapt legume technologies to close yield gaps and expand the area of legume production within the farm;
5. Enable learning and assess impacts at scale through strategic Management & Evaluation.

The achievements against each milestone from the N2Africa Results Framework are presented in Table 19. The progress narrative provides more detailed information behind the numbers presented in the table.

The Annual Report 2016 benefitted from various sources, namely the minutes from the Annual Planning Meeting held in March 2016 in Zimbabwe, the Annual Country Reports 2016, the Mid-term Review and Planning meetings per country and the ODK database, amongst others.

### 1.1 Project strategy, coordination and implementation, and capacity strengthening

#### 1.1.1 Project strategy

The N2Africa Master Plans are strategic project documents intended to foster a common approach across the N2Africa countries. The Master Plans completed in 2015 have been used to develop the country-specific plans. In 2016, all countries updated their country plans based on the general annual meeting that was held at Victoria Falls in Zimbabwe. This was to give more visibility and project focus on activities to improve the availability of input and output markets, labour saving technologies, business opportunities for women and household nutrition. Country-specific mid-term review and planning meetings held with partners resulted in more detailed annual country reports and work plans, which were aligned with the overall project focus.

The Podcasters and renewed website provide information to our partners and collaborators, part of a large group of people interested in what we are doing and achieving. In 2016, eight Podcasters were broadcast to inform the N2Africa network about research and project activities. We migrated the N2Africa website to a new version of the content management system Drupal to improve security and performance.

#### 1.1.2 Coordination and implementation

Sharing research-based knowledge and dissemination approaches and strengthening feedback loops both within the project and with stakeholders outside the project are key to the success of the N2Africa project. The achievement of N2Africa Vision of Success depends on establishing and sustaining long-term strategic partnerships with actors and organizations in the legume value chains being supported. Private-Public Partnerships (PPP) therefore play a key role in the implementation of legume technologies in all countries.

**1.1.2.1 Number of partnerships**

The project has far exceeded its set target for the number of partnerships to be established in 2016, by over 180%. Figure 1 and Figure 2 indicate the total number of partners at project and country levels, respectively. In total 90 partnerships were formally signed with partners, such as agricultural research institutes, universities, local governments, private input suppliers, legume buyers, processors, and development partners (Appendix I). Since 2014, a total of 103 partnerships are developed. The total number of signed partnerships increased by 11%, as compared to achieved results in 2015. In addition, over 15 new partners have been identified, some already integrated in the existing partnerships 2016, whereas others are developing implementation agreements. These new partners contribute mainly in the area of input supply support. Examples are YARA in Ghana and Tanzania, NUTEC project of Palladium Group in Uganda and Syngenta, Minjingu, ASA, MERU Agro, MEA Ltd., World Food Program in Tanzania.

**Figure 1. Total number of partnerships (target and achieved) in 2015 and 2016.**

**Figure 2: Total number of partnerships achieved per country in 2015 and 2016<sup>1</sup>.**

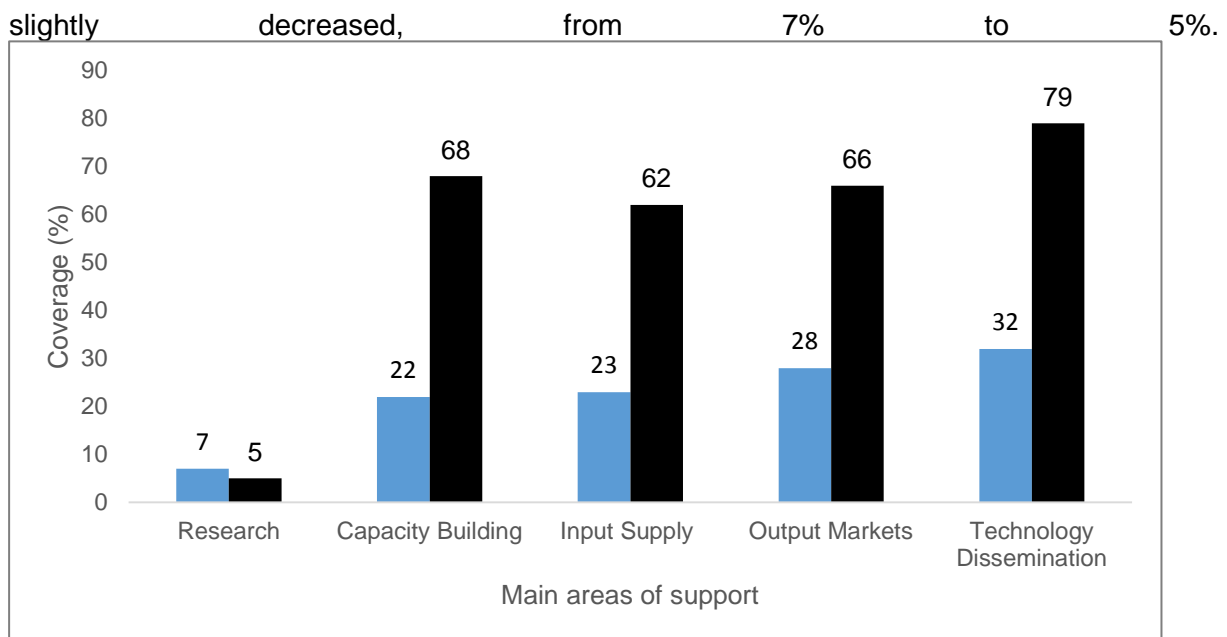

The scope of work and budget allocation is the main difference between the Core and Tier 1 countries. The Tier 1 countries have a limited scope of work and less budget available. This explains the different number of partnerships as shown in Figure 2. In 2016, countries assessed the strength of their partnerships in terms of achieving the set targets. The review resulted in new partnerships in Tanzania, Uganda, Kenya, Malawi and Borno State. In Nigeria, Ethiopia, Zimbabwe, Mozambique, DR Congo and Rwanda existing partnerships 2015 were consolidated. In Ghana, new partners supporting input supply have been identified and integrated in the existing partnerships. The Ghanaian partnerships that were not yielding desired results were terminated. Overall, 97% of 2015 partnerships were consolidated in 2016.

#### 1.1.2.2 Partnerships and their main areas of support

In all countries, partners disseminate technologies, including N2Africa best-fit technologies, and implement activities covering at least one of the following areas of support: (i) Capacity Building, (ii) Input Supply, (iii) Output Markets, (iv) Technology Dissemination and (v) Research. In 2016, the main areas of support and work plans were expanded, as compared to 2015 (Figure 3). The number of new partners were particularly related to work towards sustainable input supply systems. This area of support received much attention in 2016, because of the project's challenges to achieve its targets for input usage by target farmers across the countries in 2015. Two of such partnerships in Borno State are Intrio Synergy Limited (ISL) and CropLife. The number of new partners addressing research activities

<sup>1</sup> In this report, we refer to Borno State as a country.

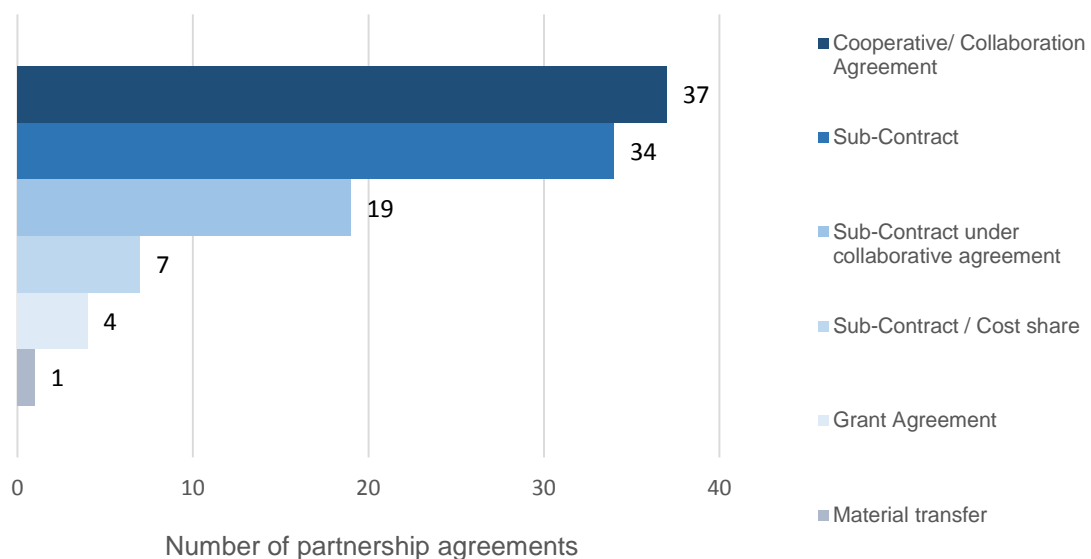

**Figure 3. Coverage of main areas of support for all partnerships in 2015 and 2016.**

### 1.1.2.3 Partnership agreement types

All N2Africa countries signed partnership agreements in the period 2014-2016. The most commonly used agreement types across all countries are Cooperative-Collaboration agreements and Sub-contract agreements (Figure 4). Sub-contracting can be done within any form of partnership. The Sub-contract agreement overlaps in other forms of agreements (e.g. Cooperative-Collaboration agreements). The seven Sub-contracts with cost share mainly cut across mainly in Nigeria. The Sub-contracts are mostly developed within partnerships to engage a partner to extend its expertise to other partners outside its operational areas or to implement interventions beyond its scope.

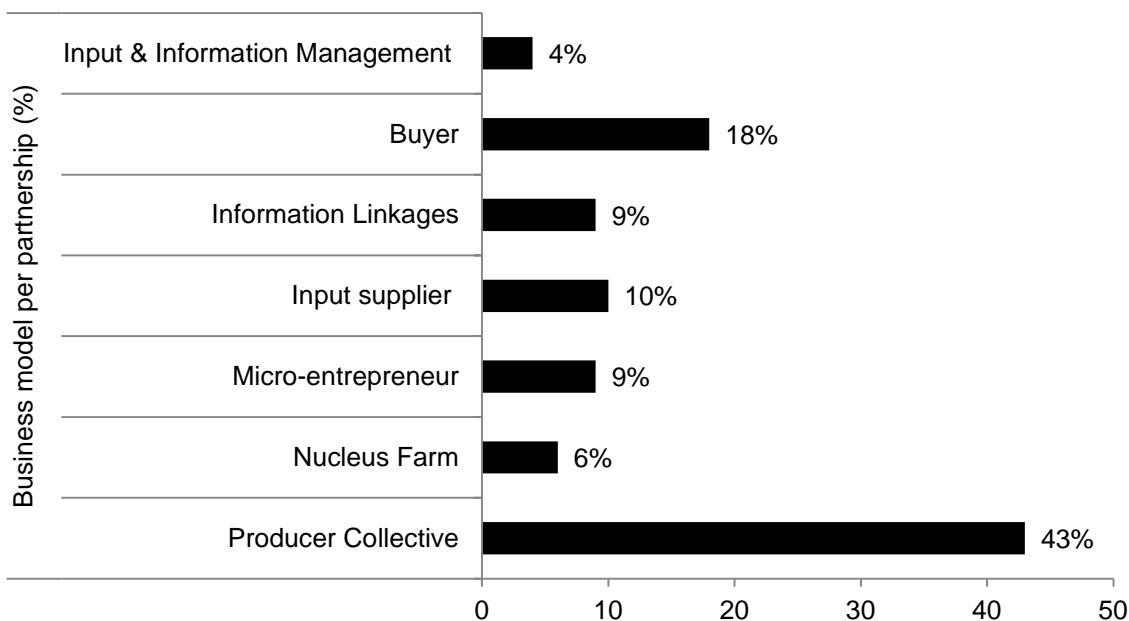

**Figure 4. Number of signed partnership agreements per type in 2016.**

#### 1.1.2.4 Partnerships per business model

To particularly tackle the challenge of sustainable input and output supply chains, N2Africa realized private public partnerships that can be classified into various business models or combinations thereof (USAID, 2015). Eight countries formalised partnerships related to improving input supply systems. For example, In trio Synergy Limited (ISL) and CropLife became Lead partners in Borno State. The approach in Kenya was slightly different; here Community Based Organizations (CBO) were linked to one-stop-shop agro-dealers for their inputs.

**Figure 5. Percentage of business models used per partnership in 2014-2016. Note: analyses are done for 67 partnerships with unique value chain or cross cutting input supply models.**

The Producer Collective model and the Buyer model were the most frequently used models in partnership agreements, 43%, 18%, respectively. The Producer Collective model focuses on building farmer collectives and infrastructure and was used in all countries, except in Nigeria and Zimbabwe. The Buyer driven model, also known as contract farming, is defined as binding arrangements leading to a vertical integration of the agricultural value chain, through which a firm ensures its supply of agricultural products by individual or groups of farmers. Both models support the N2Africa Vision of Success and link farmers to output markets. In Tanzania, for example, Catholic Relief Services (CRS) through the Soy-ni-Pesa project organized 410 producer groups with 9,477 farmers (38% female) and facilitated the bulking of soyabean. In Rwanda 3,732 farmers were involved in collective marketing through interventions done by CARITAS, Conseil Consultatif des Femmes (COCOF) and Developpement Rural Durable (DRD).

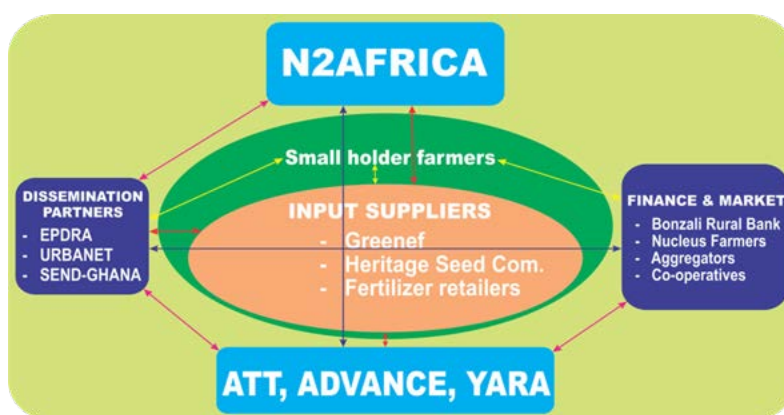

## Box I: Examples of country-specific partnership approaches

### Ghana

Grain legume production in northern Ghana is characterized with low yields due to declining soil fertility, inadequate use of farm input and lack of good quality inputs including certified seeds, phosphorus fertilizers and rhizobium inoculants. N2Africa has designed and facilitated partnership with about fourteen partners with the aim of:

- Enhancing technology dissemination and scaling up;
- Building capacities of smallholders and other actors;
- Promoting sustainable input supply and output markets.

### Tanzania

N2Africa-Tanzania is collaborating with 31 partners under different agreements categorized into; two local universities, five research institutions and 24 development organizations. Twelve (of these partners have signed the partnership agreements with N2Africa. In 2016, The Tanzania team signed three new agreements with Clinton Development Initiative, BRITEN and ARI Ilonga.

In Tanzania, N2Africa and partners share a unified message. Partners supporting value chain projects (e.g. N2Africa, ASHC, GALA, UPTAKE, and SILT) provide information about best-fit technologies to partners in value chain project.

| Partners supporting value chain projects                                  |  | Partners of value chain projects |
|---|--|----------------------------------|
| N2Africa – BMFG, WUR, IITA, ILRI, UZ                                      | Scaling Seed Technology Project (AGRA –SSTP) | CRS –Soy ni Pesa                 |
| African Soil Health Consortium – BMGF, CABI                               |  | BRAC –Lead                       |
| Gender and the Legume Alliance – DFID, CABI, IITA                         |  | BRITEN                           |
| UPTAKE (USAID) – Farm Radio International, ASHC funded for scale up       |  | Clinton Development Initiative   |
| SILT – IDRC, Farm Radio International, AFAP, CABI, IITA, iLogix, ASA, WUR |  | RUDI-AGRA<br>FAIDA MaLi          |

The key collaboration areas in Tanzania are:

1. Delivering messages on improved legume technology through media, demonstration trials and training;
2. Making input and output supply chains function more effectively by predicting demand, stimulating supply and link agro-dealer networks to farmer demand;
3. Examining the effectiveness of different combinations of messages and dissemination approaches;
4. Providing information to supply chain partners and policy audiences, based on lessons learned.

Altogether the different projects, including its partners, aim to reach over 900,000 farmers.

### **Contributions from Partnerships**

Three main partnership types provide resource leverage to N2Africa; Cooperative-Collaboration agreement, Grants agreement and Sub-contract agreement.

In thirteen cases of Cooperative-Collaboration agreement, the budget of the development partner was shared. This gives an indication of the resources available for achieving the common objectives. This 'contribution' amounts to over \$117 million in total, which indicates leverage of resources to the N2Africa project.

In ten cases, N2Africa also received grants from partners to implement joint Work Plans. These plans comprised awarded projects from joint proposals and apply to SILT (IDRC), GALA (UK Aid), AGRA-SSTP (USAID), Sub-contract agreement from IITA-SARD-SC Maize/Soya (AfDB) to N2Africa Partnerships and grants from development partners, such as Women for Women International (WfWI), World Vision International and ZOA to IITA-N2Africa. This resulted in a total of \$4.6 million in additional funds.

The Sub-contract agreements are defined as what N2Africa disbursed to partners for specific activities. These comprise research activities as in diagnostic trials or on rhizobiology. In other cases, the Sub-contract agreements are linked to VC partners performing specific tasks not initially foreseen by the partners. The specific tasks add value to the partnership, notably regarding Monitoring, Evaluation and Learning activities. In total, \$820,000 has been the contributions of such partners to implement sub-contracted activities.

### **1.1.3 Stakeholder Platforms**

To ensure and guarantee access to input and output markets, several country-specific stakeholder platforms have either been established or linked with project activities. Table 1 shows examples of existing national and regional stakeholder platforms in which N2Africa participates. Furthermore, stakeholder platforms have emanated from partnerships, because of the varied nature of partners with diverse roles and responsibilities which requires coordination.

The platforms are of varied levels (e.g. national, regional, district) depending on the objectives and aspirations of its members. Members of these platforms include both government institutions and private sector organisations, mostly supported by development projects. Through the PPP stakeholder platform meetings in Ghana (involving YARA), farmers could access TSP fertilizer in 2016. In Ethiopia, farmer cooperatives and unions have direct linkage to the inoculant producer (MBI) and output market, such as Guts Agro Industries and Agricultural Commodity Supply (ACOS).

**Table 1. Examples of stakeholder platforms**

| Country  | Name of stakeholder platform  | Level             |
|----------|---|-------------------|
| Tanzania | Three platforms <ul style="list-style-type: none"> <li>The soyabean innovation platform led by East African Grain Council (EAGC);</li> <li>The Legume alliance led by CABI-ASHC;</li> <li>Seed policy platform led by AFAP and functioning under the SILT project.</li> </ul> | Regional          |
| Uganda   | Two platforms <ul style="list-style-type: none"> <li>SNV –OSSUP</li> <li>National Maize and beans platform</li> </ul>   | National          |
| Ghana    | One platform <ul style="list-style-type: none"> <li>Soyabean Innovation Lab</li> </ul>  | Regional          |
| Ethiopia | Emanated from PPPs <ul style="list-style-type: none"> <li>Regional and District PPP Task Force</li> </ul>   | Regional/District |
| DR Congo | One platform:<br>Humid Tropics III – R4D  | Regional          |

#### 1.1.4 Capacity development

Capacity strengthening is key to sustaining continuous delivery of legume production technologies tailored to local settings. Two key strategies for capacity strengthening have been applied, namely (i) non-degree training and (ii) degree training. Students of different levels participated in the degree trainings, which were used to build national legume capacities.

##### 1.1.4.1 Non-degree training

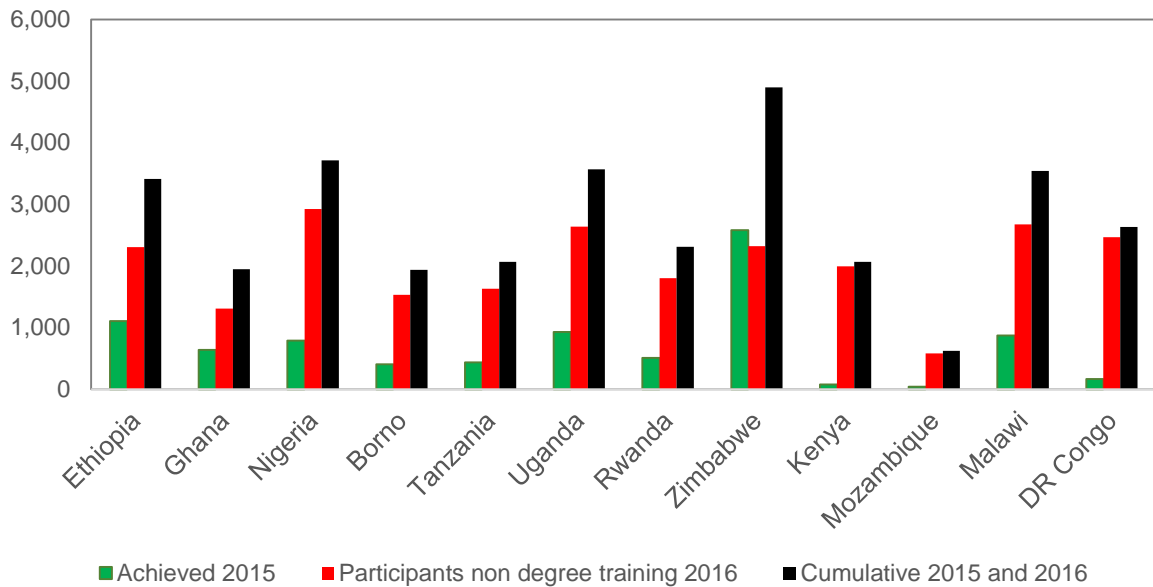

The non-degree trainings were conducted by implementing partners. Table 2 shows that the total number of persons trained in 2016 increased with 262%, as compared to 2015 achievements. Non-degree training involved both Training of Trainers (ToT) and General training. The ToT focused on enhancing the capacities of partner staff, lead farmers and farmer groups, amongst others. The general training targeted a slightly different group, namely (Lead) farmers, community based facilitators, school feeding cooks, agro-dealers and youth agripreneurs. Topics of the General training were related to collective marketing, group dynamics, strategies to access inputs, legume agronomy including seed productions techniques, legume processing and access to credit and savings. In 2016, about 72% of total persons trained were trained in a General training. Overall an equal number of women and men participated in the non-degree training, 47%, 53%, respectively.

**Table 2. Total number of participants trained through non-degree training in 2015 and 2016.**

| Persons trained in 2015 (#) | Target 2016 (#) | Persons trained in 2016 (#) | Persons trained up to 2016 (#) |
|-----------------------------|-----------------|-----------------------------|--------------------------------|
| 7,961                       | 320             | 24,172                      | 32,717                         |

Figure 6 presents the total number participants trained through non-degree training per country in 2015 and 2016. Figure 7 presents the total number of participants disaggregated by gender per country in 2016. It shows that each country surpassed the number of persons to be trained. However, there are differences among the various N2Africa countries. These differences are mainly related to disperse locations, long travel distances and unfortunate security concerns to reach beneficiaries.

**Figure 6. Total number of participants trained through non-degree training per country in 2015 and 2016.**

**Figure 7. Total number of participants trained through non-degree training segregated by gender per country in 2016.**

In Tanzania, many farmers were reached through training on legume marketing, conducted by partner BRiTEN and Faida MaLi. Partners and staff in Nigeria were re-trained on M&E data collection and N2Africa data tools. Furthermore, partners staff and extension officers were trained (ToT) on demonstration trial protocols, inoculant use and storage and legume production technology, amongst others.

Extension materials on legume agronomy and techniques developed with Africa Soil Health Consortium were distributed in Nigeria, Ethiopia, Rwanda, Zimbabwe, Kenya, and Mozambique. All materials are available on <http://www.n2africa.org/> and <http://africasoilhealth.cabi.org/materials>. Materials for Tanzania, Ghana, and Malawi are under development. In Rwanda, partners (e.g. Caritas) have adapted N2Africa materials by assembling all technologies in one book for redistribution.

#### 1.1.4.2 Degree training

The degree training targeted students at different levels (e.g. MSc and PhD students). Table 3 shows that 36 MSc students (30% female) and 16 PhD students (31% female) contributed to research activities. Details on research topics, institutions and gender of students are presented in Appendix II.

**Table 3. Breakdown of total number of MSc and PhD students trained through a degree training in 2016.**

| Country          | Student level |               |              |               | Total<br>(#) |
|------------------|---------------|---------------|--------------|---------------|--------------|
|                  | MSc students  |               | PhD students |               |              |
|                  | Male<br>(#)   | Female<br>(#) | Male<br>(#)  | Female<br>(#) |              |
| Ghana            | 6             | 2             | 2            | 0             | 10           |
| Nigeria          | 7             | 1             | 1            | 2             | 11           |
| Borno State      | 2             | 3             | 1            | 1             | 7            |
| Tanzania*        | 1             | 3             | 1            | 0             | 9            |
| Uganda           | 2             | 0             | 1            | 0             | 3            |
| Kenya            | 0             | 0             | 1            | 0             | 1            |
| Mozambique       | 0             | 0             | 1            | 0             | 1            |
| Ethiopia         | 5             | 0             | 0            | 0             | 5            |
| The Netherlands* | 1             | 1             | 2            | 2             | 8            |
| France           | 1             | 0             | 0            | 0             | 1            |
| Rwanda           | 0             | 0             | 1            | 0             | 1            |
| Zimbabwe         | 0             | 1             | 0            | 0             | 1            |
| <b>Total</b>     | <b>25</b>     | <b>11</b>     | <b>11</b>    | <b>5</b>      | <b>52</b>    |

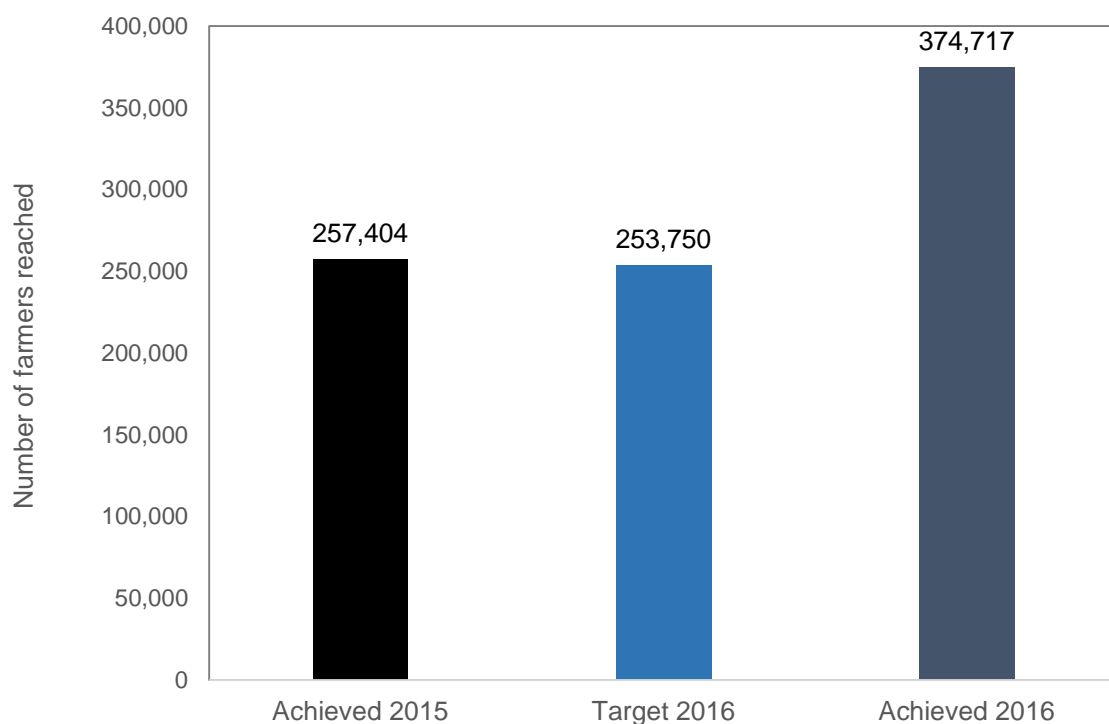

\*An additional six interns (33% female) worked in N2Africa in 2016. In Tanzania, four interns, studying on weather forecast and linked to KUKUA, a company working on weather forecast using digital weather stations, were attached to demonstration trials in Moshi and Lushoto Districts, and successfully completed their internship. In the Netherlands, two students worked on the Baseline Study and partnership analyses.

## 1.2 Dissemination, sustainable input supply and output market

### 1.2.1 Farmers reached through various dissemination activities

One of the key results to be attained in the project is the number of farmers introduced to the technologies. Farmers were reached through various dissemination activities, such as diagnostic, demonstration and adaptation trials and field days. Introducing farmers to improved legume technologies was a priority project activity during 2016. Major dissemination approaches used include demonstration trials, farmers' adaptation plots, media events and field days. In 2016, a total of 117,313 farmers were reached (49% female). In total, 374,717 farmers have been reached up to 2016 (Figure 8). The total number of farmers reached in 2016 exceeded the 2016 target by 148%.

**Figure 8. Total number of farmers reached in 2015 and 2016 (target and achieved).**

Figure 9 indicates achievements at country level between 2015 and 2016. All countries surpassed the number of farmers to be reached in 2016. However, the increase between 2014 and 2015 was larger than the increase between 2015 and 2016. The project will need to examine partners' capacity to expand their geographical area of coverage and strategize to achieve the final target.

**Figure 9. Total number of farmers reached per country in 2015 and 2016 (target and achieved).**

### 1.2.2 Dissemination activities per country

The project and its partners continue to use different dissemination approaches to reach out many farmers. Key among them are demonstrations, adaptations, field days, media events, and video shows. However, these approaches have been adjusted in some countries to include partner feedback and implementation strategies (e.g., expanding area of demonstration to accommodate more farmers and having other new farmers around adaptation plots.). In total, 1,685 demonstration and 34,897 adaptation trials were established in 2016 across all countries. Most households (41%) were reached through demonstration trials followed by field days and agricultural shows (34%). A total of 152,950 farmers had the opportunity to evaluate and learn from the disseminated legume technologies (Table 4).

Though the various dissemination approaches contributed to reaching many households and enhancing farmers' knowledge, field days still proved instrumental to reaching out to 45% of farmers in countries such as Ghana, Ethiopia, Malawi, Mozambique, and Zimbabwe. Over 80 other media events were organized in all countries.

**Table 4. Total farmers reached through various dissemination activities per country in 2016.**

| Country      | Total farmers reached<br>(#) | Dissemination activity      |                          |  |
|--------------|------------------------------|-----------------------------|--------------------------|--|
|              |                              | Demonstration trials<br>(#) | Adaptation trials<br>(#) | Field days, agricultural shows, video<br>(#) |
| Borno State* | 7,369                        | 2,000                       | 5,000                    | 369  |
| Ethiopia*    | 10,934                       | 104                         | 2,925                    | 7,905  |
| Ghana*       | 17,768                       | 10,246                      | 2,019                    | 5,503  |
| Nigeria*     | 15,841                       | 3,765                       | 9,807                    | 2,269  |
| Tanzania*    | 28,726                       | 18,907                      | 8,060                    | 1,759  |
| Uganda*      | 19,730                       | 8,976                       | 10,197                   | 557  |
| DR Congo     | 2,829                        | 1,900                       | NA                       | 929  |
| Kenya        | 5,331                        | 4,324                       | NA                       | 1,007  |
| Malawi       | 11,970                       | 6,000                       | NA                       | 5,970  |
| Mozambique   | 21,095                       | 1,200                       | NA                       | 19,895                                       |
| Rwanda       | 6,678                        | 5,448                       | NA                       | 1,230  |
| Zimbabwe     | 4,679                        | 251                         | NA                       | 4,428  |
| <b>Total</b> | <b>152,950</b>               | <b>63,121</b>               | <b>38,008</b>            | <b>51,821</b>                                |

\* Core countries

NA = Not applicable, since Tier 1 countries do not implement adaption trials.

The effectiveness of the media events (e.g., radio talk shows, video shows, among others) (including reaching out to new actors) is being assessed in Tanzania together with partner projects of Center for Agriculture and Biosciences International (CABI)- Scaling-up Improved Legume Technologies (SILT) project. In Ghana, collaboration with the African Soil Health Consortium is testing some innovative dissemination methods using videos through the GALA project.

## 1.2.3 Sustainable input supply

### 1.2.3.1 Inoculant production

One key area to enhance access to inoculants in the countries is for the project to facilitate its availability in all countries by ensuring that at least there are inoculant suppliers through the public-private partnerships. Table 5 summarises the status of inoculant supply in each country and where possible volumes produced or made available.

**Table 5. Inoculant distribution channels and volumes produced (tons and number of packets year<sup>-1</sup>). Note: the number of packets per year are based on the average size of commonly sold inoculant packets.**

| Country    | Mode of availability | Inoculant brand        | Main producer /importer  | Quantity produced/ imported | Quantity produced/ imported        |
|------------|----------------------|------------------------|--|-----------------------------|------------------------------------|
|            |                      |                        |  | (tons year <sup>-1</sup> )  | (# of packets year <sup>-1</sup> ) |
| DR Congo   | Local production     | Inoculant              | IITA   | 0.025                       | 2,500 packets of 10 grams          |
| Ethiopia   | Local production     |                        | Menagesha Biotech Industry Plc   | 20.5                        | 164,000 packets of 25 grams        |
| Ghana      | Importation          | LegumeFix <sup>2</sup> | Green-ef   | 0.7                         | 2,800 packets of 250 grams         |
| Kenya      | Local Production     | BioFix                 | MEA Ltd  | 3.5                         | 350,000 packets of 10 grams        |
| Malawi     | Local Production     | NitroFix               | Agro-Input Suppliers Limited; Department of Agricultural Research Services | 15                          | 300,000 packets of 50 grams        |
| Mozambique | Importation          | LegumeFix MasterFix    | N2Africa and Partners  | 0.003                       | 12 packets of 250 grams            |
| Nigeria    | Local Production     | NoduMax                | IITA   | 8.5                         | 850,000 packets of 100 grams       |
| Rwanda     | Local Production     | Rizobiyumu             | Rwanda Agricultural Board  | 0.96                        | 12,000 packets of 80 grams         |
| Tanzania   | Importation          | LegumeFix BioFix       | IITA <sup>3</sup> and MEA Ltd  | 1.3                         | 5,200 packets of 250 grams         |
| Uganda     | Local Production     | MakFixer               | Makerere University  | 1.5                         | 7,500 packets of 250 grams         |
| Zimbabwe   | Local Production     |                        | Soil Productivity Research Laboratory                                      | 12.5                        | 250,000 packets of 100 grams       |

<sup>2</sup> Ghana is compiling data to aid registration of NoduMax in the country as the second inoculant brand.

<sup>3</sup> N2Africa Tanzania is discussing with Export Trading Group (ETG) to start the importation of LegumeFix or to get a new importer.

Table 5 shows that the project has exceeded its target of five public-private suppliers of inoculants by 220% by ensuring that all countries (11) have inoculant supply, either through importation and or local production. This achievement made access to inoculants easy in all countries for dissemination activities and increased its availability to farmers. A total of 64 tons year<sup>-1</sup> of inoculants were either produced and or imported into all target countries. This volume equals 1,944,012 packages. Note, the different package sizes per country. Box II shows progress of Menagesha Biotechnology Industry Plc (MBI) in Ethiopia since 2013.

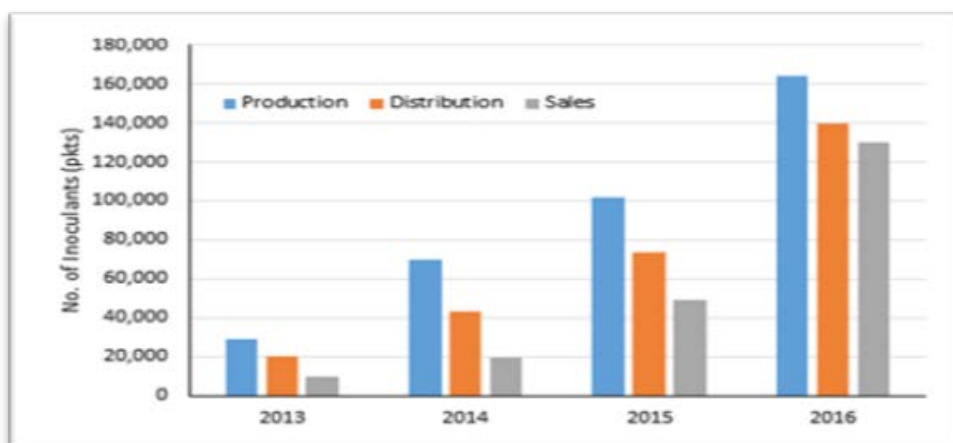

### **Box II: Inoculant production, distribution and sales performance at MBI for 2013-2016 in Ethiopia.**

As a pioneer private inoculant producing company in Ethiopia, Menagesha Biotech Industry (MBI) was established in 2012 with the objective of producing and distributing inoculants.

The production capacity of the company slightly increased from 30,000 packets (125 grams each enough for a quarter hectare) of inoculant in 2012 to 50,000, 70,000, and 102,000 packets in 2013, 2014 and 2015, respectively. Despite increased production capacity of the plant, MBI has faced different challenges, including limited awareness and use of bio-fertilizers by smallholder farmers, lack of effective input demand information, inefficient distribution infrastructure and poor business linkage all contributing to poor sales performance of the company.

The N2Africa Public-Private Partnership (PPP) has bridged key bottlenecks of inoculant technology promotion, bringing together the National Agricultural Research Systems (NARS), GOs and NGOs working of inoculant promotion, smallholders and the private inoculant producer itself. This approach has further contributed to creating inoculant access to smallholders facilitating business deals through their organization, the Farmers' Cooperative Unions and MBI.

According to the MBI CEO, 2016 was a breakthrough for MBI in inoculant production, distribution and sales as compared to previous years.

## Rizobacter: Inoculants for Africa

The presence of Rizobacter, an Argentinian inoculant company established in South Africa, is a promising sign for legume technologies. The company is, with assistance from N2Africa, actively seeking product registration in several African countries. The firm has been a major role player in the bio-fertilizer and adjuvant segments. Through its dealers, products are available in countries like Botswana, Namibia and Zambia. Rizobacter is firmly committed to making its products available to the smallholder African farmer and thus provide them with the latest technologies.

### 1.2.3.2 Dissemination of legume inputs

The poor availability of legume seed, inoculant and fertilizer was a major challenge. Various strategies were pursued in 2016 in all countries to ensure access by farmers. Most countries, such as Nigeria, Borno State, Ghana, Uganda, Tanzania, produced legume seed (mostly Certified and Quality Declared Seed (QDS)) through community seed producers in 2016. The project's research partners produced Breeder and Foundation Seed, which are used to produce Certified and Quality Declared Seed.

Table 6 shows the quantity of seed produced and used by selected farmers in four countries. On average 36% of the reached farmers in these countries used Certified or Quality Declared Seed in 2016. At project level, the volume of seed used by farmers increased with 45%, as compared to 2015, and has achieved 59% of its 2016 target. In 2016, several community seed producers were trained and linked to seed companies and farmer groups to improve access to certified seeds.

Table 6 shows that seed used by farmers far exceeded volumes produced by seed producers in the four selected countries. This implies that farmers used other stocks provided by agro-dealers and seed companies. In Nigeria, seed production increased through the integration of technologies (e.g. seed, fertilizer, inoculant) into government programs (e.g. Anchor Borrowers Program (ABP)).

**Table 6. Seed quantities produced, demanded and used by farmers in 2016 (tons year<sup>-1</sup>).**

| Country      | Quantity produced<br>(tons year <sup>-1</sup> ) | Quantity demanded<br>(tons year <sup>-1</sup> ) | Quantity used<br>(tons year <sup>-1</sup> ) |
|--------------|---|---|---|
| Tanzania     | 79.3  | 119.7   | 163.2                                       |
| Nigeria      | 195.72  | 259.2   | 277.9                                       |
| Borno State  | 58.3  | 115.5   | 158.6                                       |
| Ghana        | 75  | -   | 116.5                                       |
| <b>Total</b> | <b>408</b>                                      | <b>294</b>                                      | <b>666</b>                                  |

Note: At the time of reporting the four countries had producer group data related to quantity produced, demanded and used in 2016.

In 2016, the volume of seed used by farmers increased. The project achieved an increase of 189% compared to 2015 (Figure 10). In total, 59% of the 2016 target for volume of seed used has been reached.

**Figure 10. Volume of seed used by farmers in 2015 and 2016 (target and achieved) (tons year<sup>-1</sup>).**

In 2016, the volume of inoculants and fertilizers used by farmers increased with regards to inoculants and fertilizers. The project achieved an increase of 47% and 147%, respectively compared to 2015 (Figure 11 and 12). About 61% of volume of inoculant target (25 tons year<sup>-1</sup>) and 31% of the volume of fertilizer target (5,075 tons year<sup>-1</sup>) were achieved.

**Figure 11. Volume of inoculant used by farmers in 2015 and 2016 (target and achieved) (tons year<sup>-1</sup>).**

**Figure 12. Volume of fertilizer used by farmers in 2015 and 2016 (target and achieved) (tons year<sup>-1</sup>).**

Though the overall targets 2016 have not been met, several input supply strategies implemented in 2016 contributed in achieving results. For example, in Ghana dissemination activities with YARA resulted in an increase in P-fertilizer use by farmers (e.g. from 30.4 tons in 2015 to 150 tons in 2016). In Nigeria, the ABP program contributed to 89% sales of inoculants.

There still remains a number of input supply challenges. Despite the number of trained agro-dealers, 9% of the agro-dealers in the Core countries stocked inoculants in 2016. The main reasons were the limited shelf life and the risk of contamination due to large inoculant packet sizes. Furthermore, many farmer groups were not able to quantify input demand, before the start of the season (e.g. in Tanzania, only 13% of the producer groups provided estimates of their fertilizer demand for supply by agro-dealers).

#### 1.2.4 Output market access and collective marketing

The focus of the project is to ensure farmers have access to output market resulting in improved income. In addition, adding value to grains is key to ensure household consumption and alternative income generation from legumes. In total, 119,690 persons, with 49% female were involved in collective marketing and value addition. Various legumes (mainly soyabean) are processed into high value products, such as soyabean flour, beverages, blend of soyabean flour and other cereals, soyabean cake, groundnut oil and cake, amongst others. The scale of operation was both at household and commercial level, using certified factories (e.g. Kenya).

Collective marketing activities were mostly done through bulking by cooperatives, using formal and informal agreements. The number of farmers accessing output markets (e.g. bulking, cooperatives) is 96% of the target set for 2016 (Table 7). The number of farmers that accessed output markets increased by 35% compared to 2015. The volumes of legumes sold increased substantially in some countries (e.g. Kenya volume of soyabean sold increased by 57%). The increase in number of farmers that accessed output market 2015-

2016 was less as compared to the increase in number of farmers that accessed output market 2014-2015. Various strategies on input-output markets were integrated in the partnerships (e.g. identifying partners with output market expertise to link farmers to buyers and integrating buyer preferred varieties). Although these strategies contributed to achieving the results 2016, several reasons accounted for the decreased percentage of change:

- In Ghana, the major trend indicates that most farmers have quantities of unsold grains of soyabean (some from 2015), because of low prices. Soyabean farmers in Northern Ghana face higher competition due to importation of soyabean (cake).
- Rejection of grains due to low quality;
- High storage cost for bulking and delayed payments.
- Informal agreements with most buyers.
- Most processors are still using local processing techniques, with packaging and hygiene standards as key challenges.

**Table 7. Number of farmers accessing output market in 2015 and 2016 (target and achieved).**

| Achieved 2015 | Target 2016 | Achieved 2016 |
|---------------|-------------|---------------|
| (#)           | (#)         | (#)           |
| 80,603        | 125,000     | 119,690       |

**Box III. Cooperative Kundumurimo; producing soyabean and bush bean seed in Rwanda.**

At the end of Phase I, a group of farmers, now a cooperative called Kundumurimo, started specializing in seed production for soyabean and bush bean. Nowadays, the cooperative sells seed at community level. The cooperative was trained by N2Africa to become a certified seed grower, registered by Rwanda Agricultural Board (RAB). The seeds are produced on a piece of land of 40 ha in a swamp. This swamp provides irrigation possibilities and offers an opportunity to grow seed even off season. The cooperative produces certified soyabean seed and sells them to the Clinton Development Initiative.

## 1.3 Empower women to increase benefits from legume production

Photo Ken Giller, 2016

Various interventions are being implemented to empower women beneficiaries. These interventions are based on results of gender analysis which identify constraints limiting women participation. The selected interventions include gender specific themes for dissemination activities, identifying business opportunities and supporting their establishment, developing the processing aspects of the value which is key to women, and finally, ensuring the availability of appropriate labour saving tools to resolve drudgery. These interventions are integral part of all partnership agreements depending on the needs.

### 1.3.1 Overall women participation

About 37% of the lead farmers are female, implementing dissemination trials (e.g. demonstration and adaptation). On average, 42% of the participants of non-degree trainings are female. Overall, women participation in the dissemination activities was about 49%. These women host demonstration and adaptation trials and build capacity of other farmers across the value chain segments (e.g. production, processing, marketing, value addition, amongst others).

### 1.3.2 Legume processing tools improving nutritional status

Legume processing is a key component to improve household utilization of legumes with a subsequent improvement in nutritional status. It also serves as alternative source of income for women. Activities to support legume processing are integral part of partnerships. Mostly women are trained in the processing of legumes into various products. At country level, opportunities, such as school feeding programs and self-help groups, are identified and combined with activities relating to processing legumes into high value products. In addition to training, over 5,000 women are involved in processing of various products at both household and commercial levels.

To understand the extend of consumption of soyabean products among N2Africa beneficiaries, a study was conducted by the N2Africa Kenya team and led by Ms. Mayam Imbumi. Farmers reported that among children soyabean consumption was important for improving growth and preventing gastrointestinal and health problems. Furthermore, farmers acknowledged that soyabean consumption prevent lifestyle diseases in mothers above 50 years, and contribute to financial gains.

### 1.3.3 Labour-saving tools

Drudgery is one key constraint within the legume value chain, especially among women. Based on evaluation feedback in 2015, beneficiaries in countries, including Ghana, Nigeria, Tanzania, Malawi and Kenya, have started using labour-saving tools. Other countries conducted an inventory of available labour saving tools in consultation with partners and evaluated soyabean planters, herbicides and soyabean threshers.

**Figure 13. Number of farmers using labour saving tools in 2016 (target and achieved).**

In 2016, 63% of the target was reached (Figure 13). About 80% of farmers using labour saving tools are using herbicides, which are obtained mainly from local agro-dealers in the communities. On average, 20% of the farmers are using other tools, including soyabean threshers, groundnut sheller, planters, amongst others. The use of planters is still very minimal. For example, a study in Malawi assessed for example the effectiveness of a groundnut thresher (Box IV). In Borno State, CropLife assessed and started a Spray Service Providers (SSP) Network. Key challenges as indicated by farmers are the limited number of

service providers, leading to high cost and delays in access the tools, inappropriate tools (e.g. groundnut sheller in Tanzania). Though planters have been identified as one of the key labour saving tools, access to these tools has been a challenge due to high cost and limited availability. The service provider model has been identified and a few countries, such as Ghana, Nigeria, Malawi and Rwanda, already identified interested service providers (including Cooperatives in Rwanda) to integrate planters in the dissemination activities.

#### Box IV. Results of using groundnut sheller in Malawi

| Performance criteria<br>groundnut sheller                             | Threshing machine   | Threshing manually |
|---|---------------------|--------------------|
| Time needed to thresh one bag of groundnut (30 kg bag <sup>-1</sup> ) | 9-12 minutes        | 480-800 minutes    |
| Breakage (%)  | 2-3%                | 1-2%               |
| Germination test (%)  | 96-100%             | 97-100%            |
| Number of bag of groundnuts threshed (30 kg bag <sup>-1</sup> )       | 70                  | -                  |
| Number of people who have accessed the threshing machine              | 60 women and 14 men | -                  |

#### CropLife Nigeria assessed contract sprayers in Borno State and started a Spray Service Providers (SSP) Network

As part of the monitoring activity done by CropLife Nigeria, the full Spray Service Providers training course was recommended, paying special attention to the practical exercises.

- Crop Life trained 45 Spray Service Providers;
- 41 SSP on average served 593 farmers in one month (approximately one SSP served 15 farmers);
- 85% of the SSPs supply other service in addition to pesticide application;
- 73% scouts for pests and diseases, while 41% provides planting services.
- 85% of the respondent indicated that farmers are always willing to pay the price they are asking for.
- Almost half of the SSPs is very satisfied with their earnings, 44% indicated it is okay.

### 1.3.4 Businesses opportunities for women

The key to supporting and developing businesses within the values for women is identify opportunities. Situation analysis to identify business opportunities for women have been conducted either through partner systems or formal studies. Box V provides an example of a detailed study conducted in Tanzania to identify women business opportunities. In all, over 15 new business opportunities have been identified across the countries and the value chains' segments and will be pursued in 2017.

#### Box V. Study on women business opportunities

Situation analysis to identify business opportunity for women was conducted using 43 women groups in production, processing and trading of common bean in Northern Tanzania and 192 women in production, marketing and processing of groundnuts Central Tanzania. The strategy for 2017 is to build the capacity of women on good agronomic practices, business skills and product quality and link them with institutions in marketing, processing and value addition to ensure sustainability.

**Table 8. Study results to identify women business opportunities in Tanzania.**

| Zone                          | Business opportunity                                       | Strength and opportunities  | Weakness and Threats   | Remark  |
|-------------------------------|--|---|--|---|
| <b>Central - groundnut</b>    | Groundnut flour for children, pregnant and nursing mothers | Ready market; Raw Materials available   | Lack knowledge on preparation; Aflatoxin   | required training on preparation and on entrepreneurship                                  |
|                               | Powder of groundnuts for spicing vegetables                | Ready market; Raw materials available   | Common to many households  | Feasible for villages with low production potentials                                      |
|                               | production of groundnut quality declared seeds             | Ready market<br>Women are interest and have experience in groundnut production  | Lack of knowledge on seed production<br>Lack of foundation seeds   | Feasible for areas with high production potentials<br>Training on QDS production needed   |
| <b>Northern - common bean</b> | Bean production  | Ready market<br>Women interested in bean production<br>Required input available | High incidences of pest and diseases<br>Lack of quality seeds<br>Lack of capital                           | Highly feasible   |

### 1.3.5 Businesses led by women

Some businesses were established to identify such opportunities. The project aims to establish at least two businesses per each core country (a total of ten by end of the project) with a target of seven businesses to be established in 2016. Figure 14 and 15 show the number of women businesses established at project level and the number of women involved, respectively. An increase of over 120% was achieved on the 2016 target of businesses to be established. There was also a 22% increase in the number of women involved with about 60% being in seed production. Livestock feed as a niche market was identified in northern Ghana by one of the N2Africa PhD students.

**Figure 14. Number of women businesses established in 2015 and 2016 (target and achieved).**

**Figure 15. Number of women involved in 2015 and 2016 (target and achieved).**

## Box VI. Gross profitability analysis for seed production in Uganda

Gross Profit Margin Ratio= (Gross profit/sales) x 100

1. Seed sales Ushs3,025,000
2. Cost of production of seed Ushs1,138,750
3. Gross Profit Ushs1,886,250

Gross Profit Margin Ratio: 62%

### Development of new businesses in Rwanda

N2Africa in Rwanda was very successful with BNF technologies increasing legume productivity and the level of technology adoption was strong. There are a number of local initiatives who took over from the formal technology dissemination process and contribute to ensure continuity of N2Africa interventions in Rwanda.

Mrs Nyirandama Marie, Lead farmer in Kamonyi District, Rwanda for example stated: “I started working with N2Africa in February 2010 with a demonstration plot of beans and cassava. I started using mineral fertilizer and improved seeds and became a lead farmer helping other farmers using these technologies. I planted 1.8 kg of bean and harvested 32 kg and sold 10 kg to Conseil Consultatif des Femmes (COCOF) to disseminate the seed to other farmers. Five kg was sold to my neighbours. I planted 15 kg using modern techniques, and harvested 250 kg in 2011A. I sold 80 kg to COCOF to disseminate to other farmers, at the price of 500 FRW kg<sup>-1</sup>. I became popular in the neighbourhood, because of the new variety of bean, RWR2245. Everybody was looking for this new variety and I continued to grow this bean. We grew it during three seasons. On average, we harvested 200 kg each season, sometimes even 300 kg per season. Per year, we have around 600 kg of bean harvested. We keep around 100 kg for home consumption. On average, we sell at 450 FRW kg<sup>-1</sup>, now it is 500FRW kg<sup>-1</sup>. It is a superior variety in terms of cooking time, taste and colour. We have a good market for seed and grain of RWR2245 bean variety.”

In addition to women businesses, youth are also supported under N2Africa Borno State to earn a living through engagement in the various value chain activities. At least 2,000 youth living in Borno State are to be engaged in agribusiness models. In total 87 trained youth agripreneurs were empowered with starter packs (worth US\$117,000) to commence business activities. A total of 127 youth (28 % female) have been trained and are engaged in various agribusinesses with the expectation of each creating direct and indirect job opportunities for at least ten other youth in Borno State.

## 1.4 Tailor and adapt legume technologies to close yield gaps and expand the area of legume production within the farm

### 1.4.1 Diagnostic, demonstration, and adaptations trials

A total of 428 diagnostic trials were established in 2016 responding to key research questions emanating from dissemination activities with partners (Table 9). A total of 2,183 demonstration trials were established focusing on disseminating a single or a combination of technologies. The demonstration trials showcased the best-best technologies to large numbers of farmers and are used to collect data on the performance of these technologies. Evaluation of these technologies are conducted with farmers to ascertain their preferred technologies which are used to reshape the technology packages to be accessed by farmers. Adaptation trials are small trials established and managed fully by farmers (with limited backstopping) to determine how technologies are adapted by farmers to their settings. In 2016, a total of 29,178 adaptation trials were established by farmers on their farms. A selection of these adaptation trials are closely monitored to assess the performance of the technologies under the heterogeneous farmers' conditions and management. Table 9 gives an overview of the total number of trials established in the Core and Tier 1 countries in 2016.

**Table 9. Total number of trials per type established in 2016.**

| Country      | Diagnostic trials | Demonstration trials | Adaptation trials |
|--------------|-------------------|----------------------|-------------------|
|              | (#)               | (#)                  | (#)               |
| Ghana        | 15                | 394                  | 2,019             |
| Nigeria      | 88                | 638                  | 4,088             |

## 1.4.2 Results from adaptation trials

Table 10 shows the relative yield increase (%) of various legumes on N2Africa plots (adaptation trials) as a proportion of the yield on control plots (farmer main field plots) in 2016. These yields are plot-level estimates based on ten by ten meter plots, located in Ghana, Uganda and Tanzania. There is an experimental error associated with such estimates, which may inflate the proportion of fields with more than 50% yield gain. Regarding yield gains, the relative increase ranged from 13% to 138% across the countries and legumes for N2Africa plots compared to the control. Cowpea yield on the N2Africa plots in Tanzania yielded 138% as compared to the control plots, 61% in groundnut yield in Ghana and 13% climbing bean in Uganda. The latter increase was not significant, related to the observation that responses to TSP were low in the 2016B season.

**Table 10. Preliminary results of adaptation trials in 2016.**

| Country  | Legume        | Mean Yield N2A         | Mean Yield Control     | Mean absolute increase | LSD * | Increase Relative | Observed proportion of plots with yield gain >50% | Sample size                                |
|----------|---------------|------------------------|------------------------|------------------------|-------|-------------------|---|--|
|          |               | (kg ha <sup>-1</sup> ) | (kg ha <sup>-1</sup> ) | (kg ha <sup>-1</sup> ) |       | (%)               | (%)   | # control versus treatment comparisons (n) |
| Ghana    | Soyabean      | 1470                   | 1077                   | 393                    | 65    | 36                | 46  | 61   |
| Ghana    | Groundnut     | 1578                   | 981                    | 597                    | 152   | 61                | 54  | 54   |
| Uganda   | Climbing bean | 1986                   | 1758                   | 228                    | 424   | 13                | 28  | 18   |
| Tanzania | Bush bean     | 418                    | 297                    | 121                    | 25    | 41                | 42  | 151  |
| Tanzania | Cowpea        | 602                    | 253                    | 349                    | 39    | 138               | 81  | 158  |
| Tanzania | Groundnut     | 929                    | 811                    | 118                    | 158   | 15                | 33  | 9  |

\* Least Significant Difference

The proportion of N2Africa plots with more than 50% yield was also high for soyabean and groundnut in Ghana, 46%, 54%, respectively. Similarly, 42% of bush bean plots, 81% of cowpea plots and 33% of groundnut plots in Tanzania showed a yield gain of over 50%. In Uganda, N2Africa climbing bean plots yielded over 50% more than farmers' plot in only 28% of the cases. The very low yields observed for Tanzania reflected the effects of poor rainfall on productivity.

In terms of recommendations, the distributed packages resulted on average in yield gains. The various technology packages were, because of the yield increases, integrated in the dissemination activities (e.g. demonstration and adaptation trials). These enabled farmers to learn, assess and evaluate such technologies for adoption to improve their productivity.

**Table 11. Selected recommended technology packages in 2016.**

| Country  | Legume        | Treatment   |
|----------|---------------|---|
| Ghana    | Soyabean      | Soyabean varieties (Atairak, Soungpung), TSP, Inoculant                   |
| Ghana    | Groundnut     | Groundnut varieties (Samnut 22, Samnut 23), TSP                           |
| Ethiopia | Bush bean     | Bush bean varieties (Nasir, Anger), DAP                                   |
| Uganda   | Bush bean     | Rwr (iron-enriched 2154, iron-enriched 2245, TSP                          |
| Uganda   | Climbing bean | Flat white, nyiramuhondo (iron-enriched, Nabe 12c), TSP                   |
| Uganda   | Soyabean      | Maksoy 2N, Maksoy 3N, Maksoy 4N, Maksoy 5N, TSP and MakbioFix (inoculant) |
| Tanzania | Bush bean     | NPK fertilizers and seeds of improved varieties (Jesca and Lyamungu 90)   |
| Tanzania | Cowpea        | Cowpea improved variety (Tumaini, vuli, raha), DAP, insecticide           |
| Tanzania | Groundnut     | Farm yard manure, Minjingu Rock Phosphate (MRP) and gypsum                |

Table 11 indicates selected country specific technologies disseminated. In Tanzania, NPK fertilizers and seeds of improved varieties emerged as most farmer preferred especially for farmers in Moshi District. Though in Lushoto District, there was no significant response to NPK in most the demonstrations. Nevertheless, the use of NPK fertiliser in bean production is firmly recommended in Northern Tanzania based on previous experience. Recommended input packages for groundnut are readily available and more affordable to smallholder farmers in Kongwa District. However, the emerging challenge is to transfer these legume-based technologies and to facilitate farmers' use, considering diverse farm factors. For example, good yields were obtained in fields where soil moisture prevailed and vice versa. This therefore requires a critical analysis of available data to identify niches (soils, other environmental factors) and develop recommendation domains for use of tested technologies.

In Uganda, the results showed that location effect was significant, resulting in bush bean yield response three times better in Kibale District than in Rakai District. These findings are useful and indicate a need to devise strategies to adapt to poor rainfall. In case of TSP. Use of TSP requires agro-dealers to supply, as it is not available in the input shops in both locations. Whereas, the bio-fortified bush beans are promoted for nutritional purposes, the marketability is important to farmers for their uptake. Preferred market traits, such as seed size, should be included in the criteria for selection of varieties for dissemination. Production of climbing beans improves by applying lime and phosphorus (Figure 16). Soyabean yield benefited from applying inoculants and phosphorus (and lime). These packages could be released for adaptation trials in 2017 and the extent to which these technologies close yield gaps will be analysed, including 2016B data (not yet harvested) for their profitability. These technologies also need to be customized to different types of farmers and cropping systems.

**Figure 16. Grain yield of climbing bean (NABE 12C) to different combination of fertilizer blends, 2016A in Uganda.**

In Ethiopia, the application of phosphorus and/or inoculants resulted in increased yields in most of the trials, though there was wide variability in responses across farms in different agro-ecologies. Phosphorus application to soyabean resulted in only 10% yield increase, thus indicating how farmers lose the benefit of the application of P-fertilizer without sufficient nitrogen available to the plant, for which inoculation provides the most affordable option for resource poor farmers.

Farmers benefiting from legume crop residue in Ghana.

### 1.4.3 Use of crop residue for livestock feed

Intensification of crop-livestock interactions is done through enhancing feed availability of legume crop residues, amongst others. The niches for use of legume crop residues within and between farms have been identified in Ghana through the PhD study of Daniel Akakpo. The study results stimulate availability of feed in the dry seasons in northern Ghana. Farmers have been trained in handling and storage of legume crop residues for dry season feeding livestock. Haulms of legumes (e.g. soyabean, cowpea and groundnut) are stored by livestock farmers or by other farmers, who sell or exchange the haulms for manure. About 900 farmers are expected to store and trade legume residues during the dry season.

In Ethiopia, the results of a study to evaluate farmers' perception showed legume haulms are used as feed (77%), fuel (12%), mulching and compost making (9%) and income generation (3%). About 62 of the respondents perceived inoculant and P-fertilization as having positive impact on haulm biomass yield. Analysis of the biomass yield data revealed that soil fertility treatments resulted in a significant ( $P < 0.05$ ) improvement in haulm dry matter yield over the control, except for chickpea. Variations were, however observed among the studied legumes in their responses to the selected treatments. A study on the nutritional quality of the grains and crop residues revealed significant improvement in % crude protein content. For example, Figure 17 presents the effects of P-fertilizer and inoculant on haulm crude protein content of common bean, Shalla District, Ethiopia.

**Figure 17. Effects of P-fertilizer and inoculant on haulm crude protein content of common bean, Shalla District, Ethiopia (DM%).**

Key: C = Control (-I-P), P = Phosphorus fertilizer without inoculant (+P-I), I = Inoculant application without Phosphorus fertilizer (-P+I), P+I = Phosphorus fertilizer and inoculant (+P+I)

#### 1.4.4 Rhizobiology

Key interventions of N2Africa under rhizobiology were to isolate, authenticate and evaluate new strains of rhizobia for the target legumes. Analyses for high symbiotic effectiveness identified elite strains and inoculant formulations for bean, groundnut and cowpea. The competitiveness and survival of introduced strains as affected by management and environment were evaluated. And finally, standard operating procedures for the production, quality control and application of rhizobium inoculants were developed. A total of 446 new strains (e.g. 300 in Uganda, 128 in Ethiopia and 18 in Tanzania) have been isolated and 920 candidate strains authenticated (including isolates from 2015). These include strains for chickpea, common bean, faba bean and soyabean in Ethiopia, climbing bean in Uganda, common bean in Tanzania and cowpea in Nigeria. Eight of these strains have been identified as elite strains (e.g. chickpea in Ethiopia, common bean in Tanzania and climbing bean in Uganda). In Ethiopia, the effective candidate strains are being tested in Strain x Variety field trials for verification, before being made available for inoculant production.

**Table 12. Details of country specific strain isolation and evaluation.**

| Country  | Type of Legume | New isolates (indigenous) collected | Candidate strains evaluated and authenticated | Elite rhizobia identified |
|----------|----------------|-------------------------------------|---|---------------------------|
|          |                | (#)                                 | (#)   | (#)                       |
| Ethiopia | Chickpea       | 40                                  | 28  | 3                         |
|          | Common bean    | 43                                  | 23  | -                         |
|          | Fababean       | 30                                  | 24  | -                         |
|          | Soyabean       | 15                                  | 6   | -                         |
| Uganda   | Climbing bean  | 300                                 | 9   | 3                         |
| Tanzania | Common bean    | 18                                  |   | 2                         |
| Ghana    | Soyabean       |                                     | 7   |                           |
|          | Cowpea         |                                     | 7   |                           |
|          | Groundnut      |                                     | 6   |                           |
| Kenya    | Pea            | 11                                  | 2   |                           |
|          | Soyabean       | 67                                  | 8   |                           |
| Nigeria  | Cowpea         | 800                                 | 800   | -                         |

For characterization of rhizobium for use as inoculant strains it is critical to determine its ability to nodulate effectively. A greenhouse experiment was conducted using ten selected isolates from a greenhouse at Embrapa Agrobiologia, Brazil. Seven out of ten isolates could induce nodule formation. DNA Extraction and Partial Sequencing of sixteen SrRNA gene was also done in Ghana. Cluster analysis showed that five of the isolates belonged to the *Bradyrhizobium japonicum* clade. The characterization of strains in Ethiopia is underway using commercially available strains (EAL-029, HB429, EAL-110) as references in the evaluations.

In all, four elite strains have been identified for inoculant production out of which one has been advanced into production as a faba bean inoculant in Ethiopia. In Ghana, twenty candidate strains are being evaluated and a study is also ongoing in northern Ghana to evaluate seven strains (NC92, SNN336, MJR493C, SBG234, IGB469, SNN345, and BR326) using cowpea and groundnut hosts. The strains were gathered from N2Africa collaborators in different countries to ascertain whether these strains could be readily advanced into inoculant production.

#### 1.4.5 Inoculant quality control

N2Africa supports quality control of inoculants being used in the various countries through partnership with in-country institutions. Currently, quality control is carried out in ten of the target countries (e.g. Nigeria, Ghana, Ethiopia, Tanzania, Uganda, Zimbabwe, Kenya, Rwanda, DR Congo and Malawi). Efforts made include supporting government institutions, such as Sokoine University of Agriculture (SUA) in Tanzania and Mozambique Agricultural Research Institute (IIAM) in Mozambique, with equipment for quality control. Due to staff turnover, planned quality control activities have not yet started in Mozambique. Table 13 shows quality control results in Tanzania, Ethiopia and Ghana.

Routine quality control tests were conducted in most countries, either by the inoculant producers or designated institutions in the target countries. So far, N2Africa has results from Kenya, Ghana, Nigeria, Tanzania, Ethiopia and Uganda for the following products; BioFix, NoduMax, LegumeFix, MakFix, and inoculants from Menagesha Biotechnology Industry Plc in Ethiopia.

**Table 13. Quality Control results of inoculants in Tanzania, Ethiopia and Ghana.**

| Country  | Product   | Number of packages (n) | Rhizobia (CFU g <sup>-1</sup> ) |                     | Contaminants (CFU g <sup>-1</sup> ) |
|----------|-----------|------------------------|---------------------------------|---------------------|-------------------------------------|
|          |           |                        | Min.                            | Max.                |                                     |
| Tanzania | LegumeFix | 7                      | 4.4*10 <sup>6</sup>             | 5.7*10 <sup>9</sup> | 0*                                  |
| Tanzania | LegumeFix | 1                      | 1.2*10 <sup>4</sup>             | -                   | 2.4*10 <sup>7</sup>                 |

\* Not detectable (0); Not determined (-).

The inoculant quality control tests conducted by MIRCEN laboratory, Kenya indicated that both BioFix and NoduMax contain adequate numbers of rhizobia given the established threshold of  $>1 \times 10^9$  rhizobia g<sup>-1</sup> inoculant (Table 14). BioFix exceeded this threshold 5.7-fold and NoduMax 12.3-fold. However, the amount of contamination occurring in BioFix, with 29-fold more non-rhizobia than the threshold  $<1 \times 10^6$  g<sup>-1</sup>, is of concern. In contrast, NoduMax contained no detectable contaminants. This could be the result of sterilization of the carrier material.

**Table 14. Results of the inoculant quality control (QC) tests conducted by MIRCEN laboratory in April 2016 ( $\pm$  SEM).**

| Legume host    | QC samples | Rhizobia                          | Contaminants                      |

## 1.4.6 Quality control of inoculants along distribution channels

Quality control tests of inoculants have been conducted by inoculants suppliers in several countries in West Africa and in Uganda. The tested inoculants were sampled along distribution chains. In West Africa, LegumeFix (United Kingdom), NoduMax (IITA-BIP, Nigeria) and Wageningen University & Research (WUR, The Netherlands) jointly followed up on quality of LegumeFix inoculants. The inoculants were initially supplied to N2Africa in Nigeria and later transferred to Ghana (Tamale) for distribution during the 2016 growing season. The quality control tests were extended to include the NoduMax inoculants distributed over the same period in Nigeria. In Uganda, the quality of the locally produced inoculant (e.g. MakFix) was examined from samples collected from agro-dealers.

### 1.4.6.1 Distribution channels in Ghana

Results of quality control tests of LegumeFix inoculants stored in Nigeria at the time of its transfer to Ghana are presented in Table 15. The results show that the inoculant packages contained both high density of rhizobia and no detectable contaminants, which suggest that the inoculant properties were likely not compromised by storage conditions imposed in Kano. However, a great proportion of the packages were physically weakened by scratches, likely through manipulation. Results of subsequent analysis conducted in Ghana confirmed that product concentrations in rhizobia remained high before distribution. Analysis by LegumeFix Ltd. of packages collected from distribution channels in Ghana confirmed the poor physical appearance of inoculant packages (Image 1). Loss of physical integrity of packages was reported, which caused air and contaminants to get inside the inoculant package, thus compromising its quality. The major recommendation is that inoculant distribution actors, such as agro-dealers, need to improve greatly on inoculant package handling to preserve the quality of product to the benefit of farmers.

**Table 15. Results of quality control (QC) tests conducted at NoduMax on LegumeFix inoculants stored in Kano, Nigeria.**

| LegumeFix (batch Ref.) | Number of inoculant packages | Count (CFU g <sup>-1</sup> ) |              | Observation                                    |

#### 1.4.6.2 Distribution channels in Uganda

Table 16 presents data on density of rhizobia for inoculant packages (MakFix) distributed in 2016 in Uganda. These count ranges were about 2-3 units (Log) below the standard value adopted by the N2Africa project. This indicated that there is room for improvement of product handling across distribution channels. More data, such as product quality at factory gate and the status of contaminants, may be needed to address potential problems and provide solutions.

**Table 16. Quality control MakFix under distribution channels in Uganda 2016.**

| Serial number | District | Inoculant packets (#) | Cell Count (CFU g <sup>-1</sup> ) |                     | Observation                           |
|---------------|----------|-----------------------|-----------------------------------|---------------------|---------------------------------------|
|               |          |                       | Min.                              | Max.                |                                       |

| 2             | Lira     | 6                     | 7.0*10 <sup>6</sup>               | 4.6*10 <sup>7</sup> |                                       |

#### 1.4.6.3 Distribution channels in Nigeria

Studies on inoculant quality recovered from distribution channels in Nigeria focused on NoduMax. These inoculant packages are locally manufactured, which allows easy follow up on quality changes, against the initial properties observed at the factory gate (Table 17). In 2016, packages containing >10<sup>9</sup> cells g<sup>-1</sup> were issued for distribution to a main private distributor, coordinating a network of agro-dealers. Subsequently, random sampled packages from agro-dealers in different States indicated that populations of rhizobia had seriously dropped to values as low as 10<sup>7</sup> to 10<sup>6</sup>. Storage conditions were observed along the supply chain at times of sampling. However, there was no evidence that storage conditions played a clear role in product quality changes. The number of contaminants randomly increased, which resulted into poor product quality relative to the initial standard. Physical parameters (e.g. temperature) around the distribution conditions (e.g. transportation and storage facilities) are important indicators that may need to be monitored for a better understanding of quality changes to address the issues.

**Table 17. Quality control of NoduMax under distribution channels in Nigeria in 2016.**

| Date      | State / Lg       | Conditions of storage | Batch ID  | Packs (n) | Cell count (CFU g <sup>-1</sup> ) |                         |                          |                           |

To support partner institutions, carry out production, quality control and application of inoculants, Standard Operating Procedures (SOPs) for quality control and application have been developed in conjunction with the COMPRO II project. These SOPs were shared with partners in various countries. Most partners have adapted the SOPs. In Tanzania, Uganda, and Ghana, SOPs have been adapted by Tanzania Fertilizer Regulatory Authority (TFRA), Makerere University and Kwame Nkrumah University of Science and Technology (KNUST), respectively. In Ethiopia, there are drafts of Standard Operating Procedures for culture preparation, inoculant production, quality control and storage and inoculant application. These drafts are awaiting approval of the Ministry of Agriculture and Natural Resources (MoANR) in Ethiopia.

### 1.4.7 Agronomic studies and lessons learned

This year saw the completion of a number of agronomic studies reporting on findings from N2Africa agronomy trials. One study forms the culmination of a large-scale effort to draw lessons from the past six years of on-farm trials on soyabean inoculation. By analysing more than 2,000 trials across ten countries and five years, we could evaluate the overall expected benefits of the use of inoculant, as well as patterns of variation in response (Figure 18). Major findings of this study were that despite of a moderate average effect of around 115 kg ha<sup>-1</sup>, inoculation is expected to be economically beneficial in 97% of cases. However, large variation in response between years and locations was observed, much of it at the level of individual plots. This result suggests that dissemination trials may benefit from farmers observing multiple plots. Response to inoculation tended to be strongest for non-promiscuous varieties, without apparent yield penalties in the absence of inoculation, except for sites where bacterial populations seemed insufficient.

**Figure 18. Average grain yields per country year<sup>-1</sup> without inoculation (grey), with inoculation (white) (kg ha<sup>-1</sup>). Note: Grey whiskers indicate standard errors of difference within country year<sup>-1</sup>, black whiskers at the bottom right indicate the average least significant difference for between country year<sup>-1</sup> comparisons. Entries are sorted vertically by magnitude of inoculation response. Numbers between parentheses indicate the number of trials for each country year<sup>-1</sup>. Vertical grey/black dashed lines mark mean yields without or with inoculation.**

Another study done in Ethiopia provided the first systematic evidence for the benefit of inoculation in chickpea on-farm. In a multi-site, multi-year evaluation, inoculation was shown to elevate yields by an average of 400 kg ha<sup>-1</sup>, while the combined effect of inoculant and phosphorus was as high as 600 kg ha<sup>-1</sup> (Table 18). The results also suggest that the benefits from inoculation are likely to be greatest in soils that are low in nitrogen.

**Table 18. Average chickpea grain yields (kg ha<sup>-1</sup>) for control (no inputs), P, I and P+I treatments in on-farm demonstration trials in different years and locations in Ethiopia. P= 23kg P<sub>2</sub>O<sub>5</sub> kg ha<sup>-1</sup> applied as DAP, TSP or NPS; I=seeds inoculated with *Mesorhizobium* inoculum.**

Subscripts indicate the groups within location year<sup>-1</sup> (the row) different at  $P < 0.05$  level after Tukey adjustment for multiple comparisons. ns = non-significant at  $P < 0.05$ . SE and LSD are the standard error of the means and the 0.05 LSD within year location<sup>-1</sup>, respectively.

The effect of soil factors on productivity was also the subject of a diagnostic study in Ghana. This study analysed data on carefully measured farmer main-field soyabean yields as a function of soil texture, soil chemical and crop management factors. Statistical variable selection yielded a regression model explaining 50% of the observed variation in yield (Figure 19). Soil fertility parameters, particularly those related to soil phosphorus and silt content, were found to be the most influential variables.

**Figure 19. Relation between statistical model prediction of soyabean yield in four communities in Ghana (coloured separately) and observed yield in farmers' main fields.**

## 1.5 Enable learning and assess impacts at scale through strategic M&E

This objective aims at providing guidance, outline principles, allow for country teams and partners to learn lessons from monitoring experiences, and make adjustment and/or adaptations to the implementation of the project. It also provides partners with information on effectiveness and efficiency of dissemination approaches in their programmes across target countries.

### 1.5.1 ICT tools to collect data and provide feedback to stakeholder groups

To enable timely learning, integration of feedback in planning and evidence of results achieved, most challenges encountered in data flow in 2015 were partly resolved by re-emphasizing roles and responsibilities of both N2Africa and its partners, developing new strategies where possible. In 2016, N2Africa has improved greatly the flow of data from field to analysis. Most data collection was done using tablets and data for reporting has been uploaded per achieved result (e.g. feedback on performance of technology packages are accessible in addition to farmer feedback on technology preferences). Such feedback will be used in 2017 planning and to reshape technologies according to farmer preference and performance. Also, data on key indicators (Results Framework) can be accessed by country, partner and by location. The ODK database provided more uniform data for reporting across the countries, as compared to 2015. The developed online analysis tool (e.g. Shiny) uses this database and provides a summary of key variables. By generating early feedback on data analysis, country teams and data analysts can quickly draw lessons from, for example, the most recent trials and agronomic data. This has facilitated the rapid evaluation of treatment effects across agronomy trials in different countries, allowing these results to serve as input for planning of dissemination and agronomy activities in 2017 (Figure 20).

#### Agronomy data summaries

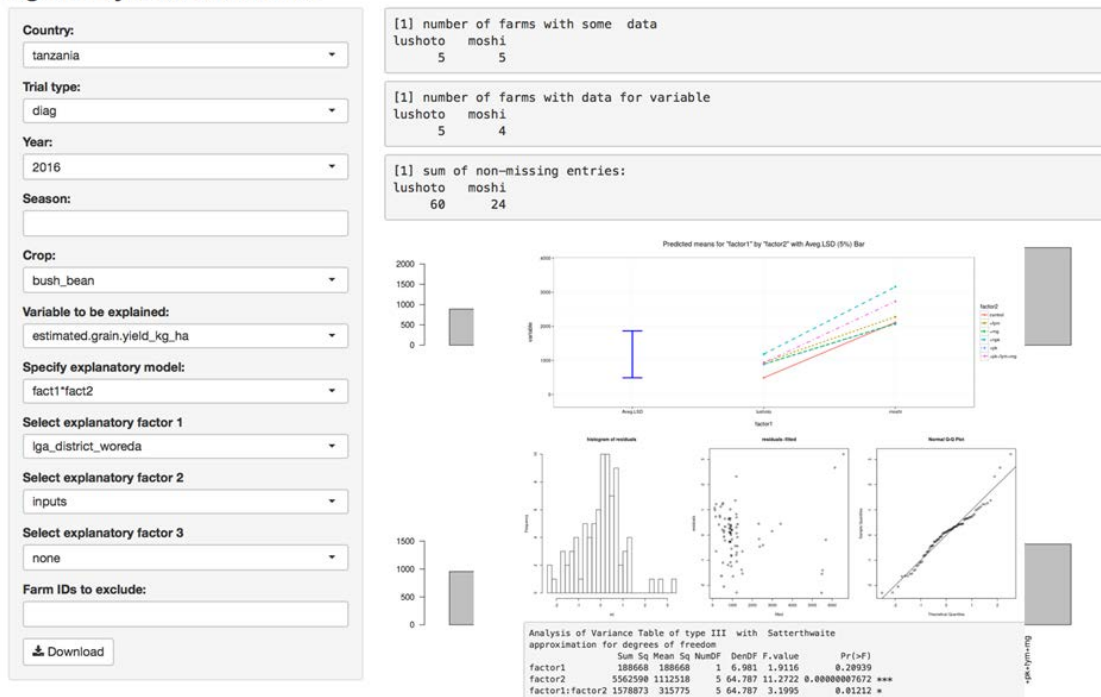

Figure 20. Combined screenshot of standard analysis of the on-line agronomy data tool, Shiny. Data for 2016 bush bean diagnostic trials in agronomy are shown.

Shiny is being finalized and available for use by all stakeholders in 2017. Furthermore, N2Africa and the GALA-project agreed to develop a common M&E framework that includes common data collection system, sharing data and data platforms. Other platforms used for feedback and learning are through Annual Planning Meetings, Mid Season's Evaluations, Periodic Meetings with specific partners and N2Africa reports.

The main challenge remains with some partners' delay in sharing data from their system, as agreed in partnership agreements. Also, the inability of some partner staff to use the ODK database remains a challenge. This needs to be addressed, as partnership agreements are amended and new strategies developed.

### **1.5.2 Recommendations Early Impact Study**

Designing development-to-research approaches that support positive changes in livelihoods of farmers require actions that are based on solid project evaluations and impact studies. The N2Africa project evaluations are based on the results framework and distinguish results on activities, outputs and outcomes. The analysis of the Early Impact Study in 2016 provided a comparison across eight N2Africa countries, that were involved in the first phase. The findings were used to evaluate N2Africa's impact, to draw lessons learned and to provide recommendations for future improvement. The next two years of the project will be used to design and implement a range of studies using quantitative and qualitative methods to examine the impact of N2Africa and maximize our learning.

## 2 Achievements in relation to project milestones

**Table 19. Progress Key Milestones Table 2016 N2Africa Project.**

| Milestone  | Indicator   | Cumulative target at grant end | Target 2016 | Achieved 2016      | % achieved target 2016 |
|--|---|--------------------------------|-------------|--------------------|------------------------|
| <b>Objective 1</b>   |   |                                |             |                    |                        |
| 1.3. Partners along the legume input and output value chains cooperate actively towards achieving the overall N2Africa goals.    | No. of partnerships developed and active.   | 32                             | 32          | 90                 | 281%                   |
| 1.4.1. By Q3 of Year 1, an internal and external communication strategy developed  | Communication plans   | 1                              | 1           | 1                  | 100%                   |
| 1.5.1. By Q4 of Year 1, country specific research and dissemination implementation plans formalized, including an exit strategy. | No. of specific research and dissemination plans formalized.  | 5                              | 5           | 6                  | 120%                   |
| 1.7.1. By Q4 of Year 1, a research plan, engaging at least five PhD and 10 MSc candidates, developed.                            | Project wide research plans to engage PhD and MSc students developed & no. of PhD and MSc students (men/women) engaged.   | 1                              | 1           | 1                  | 100%                   |
| 1.4. By Q4 of Year 5, at least 320 partners trained in N2Africa technologies and approaches.                                     | No. of persons trained (gender disaggregated data) in N2Africa technologies and approaches & no. of N2Africa technologies (by type) in which the persons were trained. <i>(Note: Count the total number of persons trained from the collaborating partners for dissemination. Disaggregate data by gender).</i> | 320                            | 320         | 32,717 (43% women) | Over 100%              |
| <b>Objective 2</b>   |   |                                |             |                    |                        |

| Milestone   | Indicator  | Cumulative target at grant end | Target 2016    | Achieved 2016   | % achieved target 2016                          |
|---|--|--------------------------------|----------------|---|---|
| 2.2. Dissemination partners attain/surpass the anticipated number of households targeted and continue to engage in legume intensification post-project.   | No. of target households (men/women) reached ( <i>outcome level: these farmers continue to engage in legume intensification activities after participating in dissemination activities</i> ).  | 555,000                        | 253,750        | 374,717 (49% women)   | 147.7 %   |
| 2.3. Local agro-dealers marketing fertilizer, seed, and inoculants are aligned with grassroot producer groups and input wholesalers and manufacturers.  | *Volume of seeds, fertilizers, and inoculants used per targeted producer group per land area, *Volume of seeds, fertilizers, and inoculants sold by agro-dealers.  | 6660; 11,100; 56               | 3045; 5075; 25 | Seed (1,532 tons); Fertilizer (1,551.8 tons); Inoculant (15.4 tons) | Seed (50.3%); Fertilizer (31%); Inoculant (62%) |
| 2.3.1. By Q4 of Years 1-4, at least two media events (e.g., radio, newspaper articles, field days, etc.) per country implemented.   | No. of media events implemented.   | 50                             | 50             | 80  | (160%   |
| 2.4. A preset (see Returns-on-Investment calculations) number of households engaged in the collective marketing and value addition of legume grains and value-added products.                     | No. of households (men/women) engaged in collective marketing, value addition of legumes, and value added products. Volume of produce sold through collective marketing, volume of value addition products, and types of value added products. | 275,000                        | 125,000        | 119,690 persons (5,869 value addition) with 49% women               | 96%   |
| 2.5.1. By Q4 of Years 1-4, inoculants available through public-private partnerships, through importation and/or local production, the latter facilitated by the inoculant production pilot plant. | No. of inoculant outlets in the target areas, volume of inoculants imported, and/or produced in the identified outlets.  | 5                              | 4              | 11 Volume imported/produced (55.9 t)                                | 275%  |
| <b>Objective 3</b>  |  |                                |                |   |   |
| 3.2.2. By Q4 of Years 4-5, at least two businesses led by women established per country.  | No. of businesses established and led by women & no. of women involved in the businesses established.  | 10                             | 7              | 16  | 229%  |
| 3.3. Better knowledge of and access to household-level legume processing tools improves the nutritional status of women and children in at least two target countries                             | No. of women using household-level legume processing technologies  | 5,000                          | 3,000          | 5,869   | 195%  |

| Milestone   | Indicator  | Cumulative target at grant end | Target 2016 | Achieved 2016  | % achieved target 2016 |
|---|--|--------------------------------|-------------|--|------------------------|
| 3.4. Women use pre- and postharvest labour-saving tools, resulting in higher net profits from legume production and processing                          | No. of women using pre- and postharvest labour-saving tools.   | 55,500                         | 25,375      | 16, 035  | 63%                    |
| 3.5.1. By Q4 of Year 3, relationships between grain nutritional quality and management/environmental conditions quantified                              | No. of relationship equations quantified   | 5                              | 5           | Relationship equation not quantified yet. A study carried out on effect of N and P on two common bean varieties (Gloria and NUA 45), P alone, or N + P at 20 kg/ha P and 40 kg/ha N in Zimbabwe. Analysis of other crops is being done | In progress            |
| <b>Objective 4</b>  |  |                                |             |  |                        |
| 4.1. Recommendations for the intensification of legume production result in at least 50% increase in legume productivity                                | % change in legume productivity among target households participating in adaptation trials (early adoption instead of adaptation trials).<br>No. of target households (men/women headed) with 50% increased productivity through adaptation trials | 275,000                        | 125,000     | -Range: 6 to 138% for soyabean, groundnut, climbing bean, bush bean, and cowpea<br>-Farmers  |                        |
| 4.1.2. By Q4 of Years 2–4, improved legume production recommendations integrated in the dissemination campaigns   | No. of improved legume production recommendations (based on diagnostic trials) integrated in dissemination campaigns   | 15                             | 15          | 19   |                        |
| 4.2. Inoculant producers avail improved inoculant formulations for the target legumes resulting in at least 10% increase in legume productivity and BNF | No. of inoculant formulations applied/used by inoculant producers for target legumes in core countries (Productivity will be measured by milestone 4.1)  | 3                              | 2           | 3 (soyabean, beans and groundnut)  | 150%                   |

| Milestone   | Indicator   | Cumulative target at grant end | Target 2016 | Achieved 2016  | % achieved target 2016                                |
|---|---|--------------------------------|-------------|--|---|
| 4.6.2. By Q4 of Year 5, elite strains used for inoculant production for beans groundnut, and/or cowpea  | # new effective and elite rhizobia identified   | 6                              | 6           | 920 candidate strains evaluated for chickpea, common bean, faba bean, and soyabean in Ethiopia, climbing bean in Uganda, common bean in Tanzania, and cowpea in Nigeria. | In progress   |
| 4.8.1. By Q4 of Year 2, standard operating procedures of quality control (storage), product registration, and application of inoculants used by inoculant producers and retailers                   | No. of inoculant producers and retailers (public private suppliers) using standard operating procedures.  | 5                              | 4           | 11   | 275%  |
| <b>Objective 5</b>  |   |                                |             |  |   |
| 5.1.1. Throughout the project, a strategic M&E framework provides timely feedback to learning and future planning   | Existence of M&E framework that outlines the types of feedback for planning, and provides timely data   | 1                              | 1           | 1  | 100%  |
| 5.2. Dissemination partners integrate effective and efficient dissemination approaches for legume technologies in their future development initiatives  | Number of dissemination partners integrating effective and efficient dissemination approaches in their programs across target countries. (Effectiveness and efficiency of dissemination approaches will be measured by activity 5.6). | 16                             | 0           |  | In progress, dissemination approaches being evaluated |
| 5.5.1. By Q4 of Year 4, the relative important of G <sub>L</sub> , G <sub>R</sub> , E, and M understood for specific legumes and production environments and integrated in improved recommendations | No. of quantified relationships integrated in improved recommendations. Best-fit recommendations available to all target legumes in each country.   | 16                             | 8           |  | In progress   |

| Milestone  | Indicator  | Cumulative target at grant end | Target 2016 | Achieved 2016 | % achieved target 2016       |
|--|--|--------------------------------|-------------|---------------|------------------------------|
| 5.7.1. By Q4 of Year 4, the sustainability of legume interventions for smallholder farmers evaluated through impact assessment studies | Project wide impact assessment conducted with available report indicating level of sustainability of project interventions | 1                              | 1           |               | This will be planned in 2017 |

## 3 Lessons learned and decisions made

### 3.1 Tanzania

- Private sector participation in partnerships creates greater synergy in technology promotion and sustainability as seen with the expansion of soyabean production as a result of readily available output market (e.g. Silver land Farms). Thus, involvement of active private sector in seed production and sale of inoculants in 2017 work plan will be priority.
- Though legume seed is recycled by many legume farmers in Tanzania, this still leaves a demand gap for certified seeds which is not easily predicted and mapped and makes the private sector hesitant to invest in small-scale farmer supply chains. The partnership with SILT project is focusing on developing an ICT solution (by iLogix) that will increase seed companies' capacity to efficiently work on smallholder seed supply by predicting, mapping and following up on demand for certified legume seeds. Meanwhile the project will focus on Quality Declared Seed (QDS) production and build capacity of QDS farmers to grow into seed companies.

### 3.2 Uganda

- Marketability of the grain legume is critical for farmers and other value chain actors (private sector) to access input and output markets. This is seen with soyabean viewed as cash crop with expanded production as reflected in the input use and grain marketing. Soyabean is thus one successful commodity that can now be disseminated on a large scale and needs characterization of dissemination domains at a large spatial scale including the economic benefits and this will require inoculation and Phosphorus at larger scales for impact.
- Use of improved varieties contributes to nearly 35% increases in yields over local varieties and this influences farmers' priority in varieties than the soil fertility inputs. Some varieties such as Iron enriched beans although high yielding and nutritious, are yet to be readily accepted by smallholders due to its grain size and marketability. Mass sensitization efforts are needed for nutrition but breeders have to consider improving traits for marketability to achieve a greater impact.
- Soil acidity management is important to improve productivity of climbing beans in highlands as well as soyabean in the low lands with acid soils. Inclusion in production guidelines is important but how to reduce costs and improve access are critical to be considered in management.

### 3.3 Ghana

- Agricultural innovation is driven by access to remunerative output market. Inadequate access to such markets by soyabean farmers as a result of importation of soyabean grains and product into Ghana resulted in farmers reducing their acreage of production and the use of inputs such as certified seeds, fertilizers and inoculants.
- Public Private Partnership (PPP) enhances accessibility to input where critical input suppliers are integrated in the partnerships. Initiation and facilitation of PPP by the project resulted in the availability of phosphorus fertilizers in northern Ghana by fertilizer companies.

### 3.4 Malawi

- The use of inoculants resulted in yield increase of between 52-54% for soyabean. A combination of inoculants, organic manure and NPK fertilizer was identified to have the highest yield.
- Double row planting of groundnuts resulted in 54% increase in both grain and stover weights.

### 3.5 Rwanda

- Partner organizations and farmers who benefited from interventions of N2Africa phase 1 are perpetuating the dissemination of technologies introduced with a minimum direct support from the project. This shows the importance of introducing technologies which address the needs of farmers. The selection of local partners is also key to mobilize community members. Partners who have means other than from the project scale up and out better technologies.

### 3.6 Nigeria

- Greater number of farmers are ready to adopt the technologies introduced by accessing them on credit. Integrating inoculants in the government Anchor Borrowers Program resulted in 89% of the total inoculant sales in Nigeria.
- In the face of climatic challenges, crop failure as result of insufficient rainfall can be avoided by early planting especially on demonstration plots and this was assisted by the early delivery of necessary inputs.

### 3.7 Borno State

- Understanding and appreciation of the principles of agricultural value chain is germane to the identification of viable agribusiness opportunities by youth. In addition, provision of tangible starter pack after training, is critical to business take-off, while access to bank credit is important to growing the business of the youths.
- Need for caution in scaling out because of the lingering issue of insurgency, notwithstanding the position of the political leadership. Likelihood of risk occurrence is high in North Eastern Nigeria.

### 3.8 Kenya

- Application of Dual Gold herbicide can effectively substitute for one hand weeding and may improve yields, but economic benefits are not pronounced. Herbicide application is best considered where labour is limited. Dual Gold may be applied as a pre-emergent to both maize and beans/soyabeans, opening opportunity to better intercropping.
- Inoculant quality control testing is reliably conducted by the University of Nairobi MIRCEN, and BioFix samples consistently exceed the rhizobia threshold, but contain excess contaminants. These contaminants do not appear to preclude response to inoculation.

### 3.9 Zimbabwe

- After a few cycles of training farmer groups, there are champion farmers that can be cost-effectively engaged to train more farmers. Therefore, relying on the more expensive 'nutrition experts' to spread the technologies is unwarranted at this stage in the dissemination pathway. New wards can be attracted to such trainings as farmers take the lead.

### 3.10 Mozambique

- The massive participation of women in the dissemination of legume technology need to be highlighted. Upscaling the use of legume technologies by making them available close to the farmers at affordable price is crucial. Given that LegumeFix are relatively easy to store for longer periods, procurement can be done ahead of time. However, whether LegumeFix will be successfully used by farmers will depend on the return on investment. At the moment, the price of LegumeFix is relatively higher when compared to MasterFix.

### 3.11 DR Congo

- The dissemination model of N2Africa is being adopted by other organizations which will ensure sustainability and continuously reach many farmers. This is being achieved through the partnerships; collaborating with local and international organizations.

### 3.12 Ethiopia

- The application of P-fertilizer and/or inoculant recorded higher in most of the demonstration trials, though there were high variability in responses across farms in different agro-ecologies. However, phosphorous application to soyabean resulted in only 10% yield increase, thus indicating how farmers lose the benefit of applying P-fertilizer without sufficient nitrogen available to the plant, which inoculation technology provides the cheapest alternative to resource poor farmers.

## 4 Challenges per country encountered in implementation

### 4.1 Ethiopia

| Description of challenge or risk  | Likelihood of occurrence | Risk management strategy  |
|---|--------------------------|---|
| <b>Topic: Government policies (regulated and import/export) and programs</b>  |                          |   |
| Fertilizer blend targeted for legume crops is not available   | high                     | Use fertilizers (DAP & NPS) with variable rates for different agro-ecologies  |
| Lack of inoculant quality control (QC) and/or lack of authority to test inoculants quality at the different supply chains   | High                     | N2Africa works closely with inoculant producers (private and public institutions) to exercise internal control; Educate stakeholders on handling of inoculants  |
| Lack of functional input demand and supply information system (as is employed for chemical fertilizers)   | Medium                   | N2Africa tries to ensure that information on input demand and supply as well as produces (marketable grain) flow through its PPPs   |
| <b>Topic: Climate in 2015 and 2016 (drought, rainfall, amongst others)</b>  |                          |   |
| 2015/16 was an El Niño year and there was late onset and abnormal distribution of rainfall. This affected a number of target locations, the severity of which varied depending on sites   | medium                   | Not much at hand to avert natural calamities to planted field, but possibilities with irrigation exploited (where possible)   |
| <b>Topic: Security</b>  |                          |   |
| 2016 was the most unpredictable season, scattered civil unrests and state of emergency. Travel to project target locations and electronic and mobile communications were almost impossible. This condition significantly affected project activities such as data collection, farmer mobilization, field days (particularly in Oromia and Amhara regions) and ultimately affected planned number of farmers to be reached in 2016 | medium                   | Capacitate partners and grass-root institutions (i.e. PCs, BoA) to follow up implementations; and frequent communication through mobile, email (if available)   |
| <b>Topic: Inflation</b>   |                          |   |
| Low prices for grain legumes versus other crops may render legumes uncompetitive in the target farming systems  | Low                      | Through PPPs and agri-business clusters, efforts will be made to create output market at domestic and international markets. Food and feed processing companies are also interested in purchasing produce 'locally' |
| <b>Topic: Pest and disease outbreaks</b>  |                          |   |
| Pests (aphids, African boll worm, bean maggot, etc.) and diseases (faba bean gall, soyabean rust, chocolate spot, etc.) infestations  | Low-medium               | Adapt the recommendations given by NARS i.e. use of resistant varieties and efficient pesticides uses and awareness creation  |
| <b>Topic: Other</b>   |                          |   |
| Staff turnover in partner organizations and less commitment of staff in partner   | Medium to High           | Engage with focal persons at partner institutions and frequent meetings to harmonize  |

|   |               |   |
|---|---------------|---|
| institutions (demands for salary top-ups and other benefits)  |               | the gaps; Extensive awareness creation; field visits to harmonize with national programs; create incentive mechanisms (allowances for communication and extra time payments)  |
| Inconsistent input (legume seed and inoculant) purchase by farmers could discourage legume seed business for private seed/inoculant producers/suppliers   | Low to Medium | Intensify input and output value chain via PPP, seed marketing business, grading and value addition of legume grains<br>Farmer segmentation and targeting for the different cropping seasons  |
| Lack of mechanized farming for legume production could lead to low enterprise competition for faba bean as compared to wheat and could limit its adoption in Ethiopian Cereal belts (Arsi-Bale) | Medium        | Intensified awareness creation on the potential of crop rotation for soil fertility maintenance and cereal disease control; on human nutritional value of grain legumes; create better market access for the legumes  |
| Inconsistent, small volume and poor quality legume grain supply can jeopardize seed business (discourage seed buyers)   | Low to Medium | Targeting farmers' organizations (like unions) or clustering farmers for realistic product bulking and grading legume seeds and foster/facilitate partnership between organized smallholder farmers and buyers and put in place quality standards for marketability |
| Committee decision making by FCU contributed to indecisiveness  | High          | Closely work with government authorities and NARS and capacitate members of FCU with marketing/business skills  |

## 4.2 Tanzania

| Description of challenge or risk   | Likelihood of occurrence | Risk management strategy   |
|--|--------------------------|--|
| <b>Topic: Government policies (regulated and import/export) and programs</b> |                          |  |
| Local government levy on farm products reducing profit for farmers           | medium                   | Addressed through soyabean platform, a group dealing with policy   |
| <b>Topic: Climate in 2015 and 2016 (drought, rainfall, amongst others)</b>   |                          |  |
| Prolonged drought  | high                     | Introduced drought and disease tolerant varieties; focus on core drought tolerant crops e.g. cowpea especially in central Tanzania |
| <b>Topic: Pest and disease outbreaks</b>                                     |                          |  |
| High incidences of pest and diseases   | High                     | Introduce disease pest tolerant varieties<br>Training of farmers on pesticide use  |
| Aflatoxin in groundnuts in Kongwa District                                   | high                     | introduced cowpea as an alternative legume; testing the use of Aflasafe bio-agent for control of aflatoxin producing fungi         |
| <b>Topic: Other</b>  |                          |  |
| Some partners not sharing data on time                                       | medium                   | Discussion with key decision makers in the organization, affirm MoU to ensure sharing of information                               |
| Reduced interest of inoculants registrants in                                | high                     | Provide registrants with the information on current demand of inoculants for them to make  |

|          |  |  |
|----------|--|--|
| Tanzania |  | decision on supply; Engage other potential registrants |
|----------|--|--|

### 4.3 Nigeria

| Description of challenge or risk   | Likelihood of occurrence | Risk management strategy |
|--|--------------------------|--------------------------|
| Topic: Other   |                          |                          |
| Life span of Inoculants designed for only one year is a big challenge to farmers | High                     | Good storage facility    |

### 4.4 Borno State

| Description of challenge or risk  | Likelihood of occurrence | Risk management strategy   |
|---|--------------------------|--|
| Topic: Security   |                          |  |
| Insecurity in North Eastern Nigeria especially in Borno State   | High                     | Working in safer areas in the state and taking precautions when travelling   |
| It was not possible to transport fertilizers in the project area due to security (fertilizer as bomb material)  | High                     | The project gave cover letters introducing one trusted agro-dealer to supply fertilizers to our farmers  |
| Striga, insect pests and diseases infestation; Incorrect use of pesticides especially herbicides  | Medium                   | Improved tolerant and or resistant crop varieties (seeds) were disseminated. Trained contract sprayers on appropriate use of agro-chemicals  |
| Low soil fertility  | High                     | Composite soil samples collected from diagnostic trials fields for analysis which will be used to determine the soil fertility status and disseminating the use of P-fertilizer (SSP), inoculants and organic manure and legume-cereal intercropping to improve soil fertility |
| There is high intention to buy NoduMax by farmers from the project area earlier in the season, but when it was supplied little was purchased by the farmers | High                     | A sustainable input supply system for farmers to access inoculants, SSP and improved seeds in Nigeria was developed and an agreement between IITA and ISL was signed to address this issue   |

### 4.5 Mozambique

| Description of challenge or risk                                    | Likelihood of occurrence | Risk management strategy                            |
|---|--------------------------|---|
| Topic: Climate in 2015 and 2016 (drought, rainfall, amongst others) |                          |   |
| El Niño   | High                     | Multiple planting, soil cover whenever its possible |
| Topic: Security   |                          |   |
| Military conflicts  | High                     | Avoid conflict zones                                |

## 4.6 Zimbabwe

| Description of challenge or risk   | Likelihood of occurrence                                  | Risk management strategy  |
|--|---|---|
| <b>Topic: Government policies (regulated and import/export) and programs</b> |   |   |
| Retrenchments of technicians at inoculant factory                            | Low   | Graduate students to help with lab procedures if needed   |
| <b>Topic: Quality of cropping season (drought, rainfall, amongst others)</b> |   |   |
| Low rainfall in mandate areas  | Very likely to occur like happened in the previous season | Farmers advised to stagger their planting date so that if one crop fails other will be harvested. |
| <b>Topic: Security</b>   |   |   |
| Civil war in Mozambique spilling into Zimbabwe                               | Low   | NA  |
| <b>Topic: Inflation</b>  |   |   |
| USD versus new bond notes  | Low   | Research funds to be kept in USD account by University of Zimbabwe                                |
| <b>Topic: Pest and disease outbreaks</b>                                     |   |   |
| Pest and disease outbreaks   | High for cowpea   | Appropriate treatment with commercial chemicals   |

## 4.7 Rwanda

| Description of challenge or risk   | Likelihood of occurrence | Risk management strategy   |
|--|--------------------------|--|
| <b>Topic: Climate in 2015 and 2016 (drought, rainfall, amongst others)</b>   |                          |  |
| Severe drought occurred in the last 2 seasons (2016B and 2017A) affected seriously crops especially legumes in East and Southern provinces | High                     | The Government is promoting hill side irrigation program, with subsidies up to 50% on equipment and installation |
| Heavy rains in high altitude regions of the Northern province in 2016B washed away crops killing human beings as well                      |                          | Settlement of the population in secure areas, soil erosion control   |

## 4.8 DR Congo

| Description of challenge or risk   | Likelihood of occurrence | Risk management strategy     |
|--|--------------------------|------------------------------|
| <b>Topic: Government policies (regulated and import/export) and programs</b> |                          |                              |
| The policies exist but are not implemented                                   | Low                      | Engage with government       |
| <b>Topic: Climate in 2015 and 2016 (drought, rainfall, amongst others)</b>   |                          |                              |
| The rains come late and sometimes no rain or too much                        | Medium                   | Impact the production! yield |
| <b>Topic: Security</b>   |                          |                              |

|   |      |  |
|---|------|--|
| Security in good in the area who operate  | Low  | We need to go or the security is guaranteed and total  |
| <b>Topic: Inflation</b>   |      |  |
| Farmers faced a problem of currency fluctuations; the price is still not stable | High | Farmers need to do collective marketing  |
| <b>Topic: Pest and disease outbreaks</b>  |      |  |
| Identification and recognition of the disease difficult for actors              | Low  | Training limited of the technical team of partners   |
| <b>Topic: Other</b>   |      |  |
| Presence of humanitarian organizations who distributed the seeds for free       | High | Hard to move to the humanitarian actions in the sustainable development This requires training and awareness |

## 4.9 Malawi

| Description of challenge or risk  | Likelihood of occurrence | Risk management strategy   |
|---|--------------------------|--|
| <b>Topic: Government policies (regulated and import/export) and programs</b>  |                          |  |
| Setting of minimum prices for produce but no mechanisms to ensure adherence   | High                     | Farmers encouraged to form associations/cooperatives to form a solid front for bargaining good prices  |
| Unavailability of qualified personnel to conduct inoculant quality checks at production, distribution and user levels | High                     | AISL following laid down procedures provided by IITA in ensuring quality is maintained. Responses from users to determine acceptability and by extension quality appraisal |
| <b>Topic: Climate in 2015 and 2016 (drought, rainfall, amongst others)</b>  |                          |  |
| Intermittent drought and rainfall curtailed too early   | Medium                   | Planting drought tolerant varieties and short season crop varieties  |
| <b>Topic: Security</b>  |                          |  |
| Theft of crops while in the field   | Low                      | Ensure timely harvesting time  |
| <b>Topic: Inflation</b>   |                          |  |
| Unstable local currency against major world currencies  | High                     | Intensification of value addition to increase opportunities for export   |
| <b>Topic: Pest and disease outbreaks</b>  |                          |  |
| Occurrence of soyabean rust   | Medium                   | Use of pesticides to control the disease   |

## 4.10 Uganda

| Description of challenge or risk  | Likelihood of occurrence | Risk management strategy                         |
|---|--------------------------|--|
| <b>Topic: Government policies (regulated and import/export) and programs</b>  |                          |  |
| The weak regulatory framework on managing aflatoxin groundnut has affected access to international markets beginning to affect local consumption with more health | High                     | Work with IITA to develop Aflasafe for groundnut |

|   |        |   |
|---|--------|---|
| ware population   |        |   |
| Introduced taxes on inputs affecting use of inputs and export marketing of grains | High   | Exploring cost effective strategies for a step up and judicious use of inputs (follow the ISFM framework)   |
| <b>Topic: Climate in 2015 and 2016 (drought, rainfall, amongst others)</b>        |        |   |
| Low rainfall and dry spells   | High   | Early planting and deploying SWC practices (ridging) where they can be applicable, explore linkages for acquisition of effective irrigation systems where water sources are available |
| <b>Topic: Security</b>  |        |   |
| Insecurity (land wrangles)  | Low    | Avoid scaling to areas that have some kind of insecurity  |
| <b>Topic: Inflation</b>   |        |   |
| Increasing costs of inputs affecting use of inputs such as fertilizers            | Medium | Providing low cost management packages  |
| <b>Topic: Pest and disease outbreaks</b>  |        |   |
| Poor quality of pesticides on the market and resistance of pests to pesticides    | Medium | Seeking quality suppliers of pesticides. Joint testing the efficacy of the pesticides with private sector and involvement the regulatory bodies (UNBS and MAAIF)                      |
| <b>Topic: Other</b>   |        |   |
| Partner organisations staff turnover  | medium | Work with several staff of organizations as an insurance measure and build local capacity (resident capacity)   |

#### 4.11 Kenya

| Description of challenge or risk  | Likelihood of occurrence (Please indicate: low-medium-high)                               | Risk management strategy   |
|---|---|--|
| <b>Topic: Government policies (regulated and import/export) and programs</b>  |   |  |
| Agricultural extension devolved from national ministry to individual counties results in discontinuation of service | High, this is indeed occurring and county level extension is slow to improve              | We work with the strongest counties, unable to carry others. County extension officers invited to all events |
| <b>Topic: Climate in 2016 (drought, rainfall, amongst others)</b>   |   |  |
| Moderate drought affects legumes more than maize, discouraging farmer adoption                                      | Moderate drought occurred in both seasons of 2016   | Healthy soyabean is more tolerant of mid- and late-season drought  |
| <b>Topic: Security</b>  |   |  |
| Post-election violence may accompany next year's scheduled elections  | Medium, severe in 2008, not so in 2013, but it seems nobody concedes defeat               | Farmers cannot afford to miss the long rains growing season so partner services proceed with care            |
| <b>Topic: Inflation</b>   |   |  |
| Weakening Kenya Shilling makes raises cost of inputs  | Low, the Shilling remains fairly stable for the past three years (about KES 100 = US \$1) | Search for better legume markets, commodity prices rise in proportion to inflation                           |

**Topic: Pest and disease outbreaks**

|                             |      |   |
|-----------------------------|------|---|
| Asian rust affects soyabean | High | Grow more resistant varieties SC Squire and SC Saga |
|-----------------------------|------|---|

## 4.12 Ghana

| Description of challenge or risk   | Likelihood of occurrence<br>(Please indicate: low-medium-high) | Risk management strategy  |
|--|--|---|
| <b>Topic: Government policies (regulated and import/export) and programs</b> |  |   |
| Importation of soyabean cake and meal  | High   | Facilitate stakeholder platform to bring about institutional innovation in marketing of soyabean grains |
| <b>Topic: Climate in 2015 and 2016 (drought, rainfall, amongst others)</b>   |  |   |
| Erratic rainfall and drought   | High   | Early maturing varieties, drought tolerant varieties, timely planting                                   |
| <b>Topic: Inflation</b>  |  |   |
| Increase in cost of inputs   | Medium   |   |
| <b>Topic: Pest and disease outbreaks</b>                                     |  |   |
| Cowpea pod borer   | Medium   | Improved and tolerant varieties, chemical control   |

## 5 Opportunities per country identified

### 5.1 DR Congo

| Description of opportunity                | Likelihood of occurrence | Management strategy   |
|---|--------------------------|---|
| Access of credit (Finance)                | Low                      | This is the first time that these associations have access to credit; ELLs have the problem to understand the financial circuit and cooperative |
| Associations must move to cooperative     | Medium                   | This is a process that takes time and awareness to understand the co-operative movement   |
| Existence of seed companies in the region | High                     | Good quality seed can be now available close to farmers   |

### 5.2 Ethiopia

| Description of opportunity   | Likelihood of occurrence | Management strategy   |
|--|--------------------------|---|
| Increasing popularity of inoculant technology for legume production and increased demand for inoculants  | High                     | -Increased involvement of ILRI-N2Africa in business facilitation/deals between MBI and FCUs]<br><br>-Increase inoculant production capacity of the private institution with due attention given to maintaining an acceptable level of quality product   |
| The need for inoculants and improved seed demand/supply information emerged as a new dimension of activity (Private seed and inoculant companies would survive the future i.e. willing to stay in the business, only if this information system is functional in the future) | Low- medium              | -Fertilizer supply/demand information is enforced by the government – demand information flow from Kebele to Woreda BoA up to Zone and Regions. Then, the supply is ensured via FCU (play a bridging roles). This hierarchy and flow is missing for inoculants and seed<br><br>-Awareness creations to government authorities about the emerging needs for inoculant/seed demand/supply information. And capacitating FCU to bridge the gap in collaboration with BoA (Woreda) local staff (DAs) at Kebeles following the same operating hierarchy as for fertilizers |
| The FCU involvement in output market is increasing (as part of the functioning PPPs), through the different FCU are at different levels  | Medium                   | -Strengthen the decision making and business skills of FCU<br><br>-Train members of FCU, together with supports from NARS, BoA officials to increase the business skills of FCU   |

### 5.3 Ghana

| Description of opportunity                               | Likelihood of occurrence | Management strategy  |
|--|--------------------------|--|
| Presence of development projects targeting grain legumes | Medium                   | Leverage with other projects in the implementation of project activities |

## 5.4 Kenya

| Description of opportunity  | Likelihood of occurrence | Management strategy   |
|---|--------------------------|---|
| Register and franchise NoduMax in Kenya and other countries to improve the selection and competitiveness of soyabean inoculants                                   | Medium                   | Coordinate NoduMax expansion with IITA Business Incubation Platform, establish franchise arrangements, obtain funds from Business Development unit  |
| Develop Sympal fertilizer into a composite fertilizer rather than a mixed blend   | High                     | MEA is developing a composite fertilizer plant, express need for composite Sympal, assist in product testing, alert agrodealers to new product  |
| Involve Youth Agripreneurs in soyabean product development and develop agribusiness spin offs   | High                     | Compile information of current status of products (e.g. soymilk, porridge), link to IYA Value-Added Business Model and new AfDB ENABLE country projects   |
| Develop granular legume inoculant, and other formulations, for application with legume seeds containing heavy doses of pesticide, particularly bean and groundnut | Medium                   | Obtain APT granulated peat, distribute to Rhizobiology team, develop protocols for processing granular inoculants, field test compared to powdered formulations, provide protocols to inoculant manufacturers |

## 5.5 Malawi

| Description of opportunity   | Likelihood of occurrence | Management strategy  |
|--|--------------------------|--|
| Wide use of groundnut threshing machine  | High                     | Increasing number of threshing machines to women farmers<br>Increase awareness during field days and any other farmers' gatherings |
| More farmers abandoning tobacco production and venture into legumes (especially Soya) production | Medium                   | Increase accessibility of legumes technology and inputs especially improved seeds and inoculants                                   |

## 5.6 Mozambique

| Description of opportunity   | Likelihood of occurrence | Management strategy  |
|--|--------------------------|--|
| CLUSA PROMAC willing to demonstrate to farmers the benefit of using new inoculants such as LegumeFix targeting large number of farms | High                     | Collaborate with provision of inoculants                                   |
| ACOF interested on testing LegumeFix on 60 ha of land and conduct field days targeting large number of farms                         | High                     | Collaborate with provision of inoculants as well as technical backstopping |

## 5.7 Nigeria and Borno State

| Description of opportunity  | Likelihood of occurrence | Management strategy  |
|---|--------------------------|--|
| <p>Abundant commercial gaps in the grain legumes value chain</p> <ul style="list-style-type: none"> <li>✓ Abundant R4D technical information to tap</li> <li>✓ Available input and output market to explore</li> <li>✓ Availability of several agricultural finance schemes and youth in agribusiness initiatives to leverage</li> <li>✓ Available professional institutional partnerships to explore – SMEDAN, BOA, BOI, etc.</li> </ul> | High                     | Engage youth to make sustainable living out of agriculture |
| <p>More Farmers and communities are asking to be involved after seeing the benefits of N2Africa technologies from N2Africa contact farmers, and more had started adapting the technologies. The farmers testify to the increased in yield after using the disseminated technologies.</p>  | High                     | Increase activities to accommodate more farmers            |

## 5.8 Rwanda

| Description of opportunity   | Likelihood of occurrence | Management strategy  |
|--|--------------------------|--|
| The crop intensification program of the government   | High                     | There are priority crops selected per agro ecological zone, Soyabean and common beans are part of this program |
| The agriculture inputs distribution network organized at national level, with significant subsidies on fertilizers and seeds | High                     | The inputs distribution network organized from national to the sector level                                    |

## 5.9 Tanzania

| Description of opportunity   | Likelihood of occurrence | Management strategy   |
|--|--------------------------|---|
| Announcement of Soyabean among the focus crop in Southern Agricultural Growth Corridor of Tanzania (SAGCOT) becomes a new opportunity for advancing N2Africa technologies across the SAGCOT area | High                     | N2Africa is registered member of SAGCOT and participate fully in Soyabean development initiatives |
| SILT, Africa Rising-NAFAKA, SAIRLA – GALA projects provides an opportunity to leverage resources and broadens N2Africa zone of influence in Southern Highlands, East and Central Tanzania        | High                     | N2Africa is a partner to these projects   |
| Inclusion of Tanzania in TAAT program creates another opportunity to extend N2Africa legume technologies to more areas in Tanzania   | High                     | N2Africa technologies included in a list of technologies TAAT will scale                          |

## 5.10 Uganda

| Description of opportunity                                | Likelihood of occurrence | Management strategy  |
|---|--------------------------|--|
| Increasing demand for soyabean                            | High                     | Better organize producer associations and sensitize them on the realistic pricing of soyabean grain                                  |
| Linking with MAIAF programme of school feeding with beans | Medium                   | Strategically link farmer cooperatives to grow bio-fortified beans   |
| Increasing inoculant demand                               | Low                      | Quality assurance and appropriate management (storage and application for better results to sustain demand)                          |
| Increasing demand for beans                               | High                     | Need to organise producer associations to produce beans to sustain school feeding programmes and thus the access to seed is critical |

|--------------------------------------|--------------------------|---|
| Well trained farmers as new trainers | High                     | Scout for good farmers for expanded training programs |

## 6 Policies relating to legume intensification

The 'N2Africa Review of national policies relating to legume intensification in N2Africa counties' showed that governments in N2Africa countries acknowledge the importance of legume intensification and its significant potential to contribute to improving food security and health, especially for poor families.

At global level, the seventeen Sustainable Development Goals (SDGs) of the 2030 Agenda for Sustainable Development developed by the United Nations (UN) aim to end all forms of poverty, fight inequalities and tackle climate change, while ensuring that no one is left behind. The SDGs recognize that ending poverty must go hand-in-hand with strategies that build economic growth and addresses a range of social needs including education, health and job opportunities, amongst others. Governments are expected to take ownership and establish national frameworks for the achievement of the seventeen goals. Particularly, SDG2 'End hunger achieve food security and improved nutrition and promote sustainable agriculture' seeks sustainable solutions to end hunger in all its forms and to achieve food security. It entails improving the productivity and incomes of small-scale farmers by promoting equal access to land, technology and markets, sustainable food production systems and resilient agricultural practices.

The Comprehensive Africa Agriculture Development Programme (CAADP) is the pan-African policy framework for agricultural transformation, wealth creation, food security and nutrition, economic growth and prosperity for all. The CAADP Results Framework 2015 – 2025 is prepared by the Food and Agriculture Organisation (FAO) of the UN in cooperation with the New Partnership for Africa's Development (NEPAD) Steering Committee. It recognizes the importance of increasing yield of food grains, tubers and legumes to catalyse transformation of Africa's agricultural systems and presents critical actions required to achieve agricultural development agenda targets. Furthermore, the Association for Strengthening Agricultural Research in Eastern and Central Africa (ASARECA) serves as a platform for promoting regional research and in the sharing of benefits and spill overs that derive from such research. The association focuses on four thematic areas that are well aligned to the major ongoing regional and continental initiatives. These include (i) Integrated capacity strengthening, (ii) Development and scaling up of technologies and innovations, (iii) Policy advocacy, market analysis and institutional arrangement, (iv) Knowledge and information management. High yielding climbing bean varieties and training on different staking options are included in ASARECA projects that scale up best practices to address farmers' needs

National governments in the N2Africa countries all developed national policies aimed at increasing agricultural productivity, improving food security, diversifying food production to improve nutrition, and increasing agricultural incomes of the rural people. All national policies refer to legumes, mostly indirectly (e.g. intercropping practices, as measure for soil fertility, amongst others). Table 20 presents the N2Africa target legumes mentioned in national policies per N2Africa country.

**Table 20. N2Africa target legumes mentioned in national policies per N2Africa country.**

| Country    | N2Africa target legumes promoted in national policies                   |
|------------|---|
| DR Congo   | Legumes, bean, cowpea, groundnut  |
| Ethiopia   | Cowpea, chickpea, bean, groundnut, soyabean, legumes, rhizobia          |
| Ghana      | Cowpea, soyabean, groundnut   |
| Kenya      | Bean, pigeonpea, cowpea, chickpea, soyabean, legumes, rhizobia          |
| Malawi     | Local inoculant, groundnut, soyabean, pigeonpea, common bean and cowpea |
| Mozambique | Bean, soyabean, groundnut, legumes, pulses                              |
| Nigeria    | Soyabean, cowpea  |
| Rwanda     | Bio-fortified bean, soyabean, rhizobia                                  |
| Tanzania   | Bean, oil seed crop, chickpea, cowpea                                   |
| Uganda     | Bean, soyabean, groundnut   |
| Zimbabwe   | Bean, soyabean, groundnut   |

All national policies aim at increasing the production and productivity of various legumes by various strategies, such as (i) adopting modern production techniques, (ii) strengthening coordination, institutional capacity and skills across the key actors, (iii) providing timely and appropriate market entry support for effective market development and (iv) scaling up production and trade, amongst others. Rhizobia are only referred to in a few national policies (e.g. Ethiopia, Kenya, Malawi and Rwanda). The Tanzanian government is the only government that developed an explicit policy tool to promote the pulses sector (e.g. common bean, cowpea, pigeonpea, green gram and chickpea, mung bean and Bambara nut).

While many policies indicate the aim of boosting production of legumes, they are surprisingly silent on specific actions and interventions as to how this might be achieved. The study results will be completed and used to provide recommendations to governments about best-fit legume technologies, how to increase production and productivity of various legumes and how to stimulate farmers' uptake and use of relevant technologies.

## Exposure

### Pan-African Grain Legume & World Cowpea Conference

The Pan-African Grain Legume and World Cowpea Conference was held in Livingstone, Zambia, in late February. The conference was organized by International Institute of Tropical Agriculture (IITA), Feed-the-Future Innovation Lab for Collaborative Research on Grain Legumes (Legume Innovation Lab), and the International Center for Tropical Agriculture (CIAT), in collaboration with major international agricultural research organizations and development partners and sponsors. N2Africa representatives presented their research results and hosted plenary presentations.

### In the News

One way that N2Africa shares its knowledge is through its vast library of Podcasters, videos, reports and scientific publications. This enables spill over benefits and maximizes the return on research investments. In 2016, N2Africa published eight Podcasters. N2Africa also published reports, extension materials and legume booklets for shared use (Appendix III). Its focus is on publishing open access.

### N2Africa staff in 2016

N2Africa said goodbye to former Senior Program Officer Charlene McKoin, who retired after three years of dedicated work. Charlene has provided wise counsel to N2Africa from her business and value chain perspective. She passes the torch to Senior Program Officer Christian Witt.

\* Type of organization: Farmer association/cooperative (fa), NGO (ngo), Government institution (gi), research institution (ri), private organization (po), others

\*\* Type of partnership: Sub-contract (s), Collaboration agreement (ca), Grant agreement (ga), Project support consultancy agreement (psca), Material transfer (mt)

\*\*\* Main areas of support: capacity building (cb), input supply (is), market linkages (ml), technology dissemination (td)

<sup>a</sup> N2Africa received grants to implement joint Work Plans with partners.

<sup>b</sup> Overall budgets from development partner, which gives an indication for resource leverage.

<sup>c</sup> Contributions of sub-contracted partners

## Appendix II – PhD and MSc student overview

**Table 22. Overview of PhD students involved in N2Africa Phase II.**

| Country         | Name                       | Gender | Research topic  |
|-----------------|----------------------------|--------|---|
| Ethiopia        | Ashenafi Hailu Gunnabo     | M      | Use of crop residues for livestock.   |
| Ghana           | Daniel Brain Akakpo        | M      | Use of grain legume residues as livestock feed resource for smallholder farmers in Northern Ghana.  |
| Ghana           | Michael Kermah             | M      | Exploring opportunities for sustainable intensification of grain legumes towards improving crop productivity, food security and livelihoods of smallholder farmers in northern Ghana.       |
| Kenya           | George Mwenda              | M      | Evaluation of competitiveness for nodulation of <i>Phaseolus vulgaris</i> L. in Kenyan rhizobial strains.   |
| Mozambique      | Amaral Machaculeha Chibeba | M      | Nodule occupancy of elite rhizobial strains inoculated in soybean in Mozambique.  |
| Nigeria         | Ojo Comfort                | F      | Host legume x rhizobium strain interactions in cowpea.  |
| Nigeria         | Tolorunse Kehinde Dele     | M      | Phenotyping and Yield Stability Studies in Soyabean ( <i>Glycine Max</i> (L.) Merrill) Under <i>Rhizobia</i> Inoculation.   |
| Nigeria         | Adediran Olaotan Abimbola  | F      | Physiological Responses of Cowpea ( <i>Vigna Unquiculata</i> (L.) Walp) Varieties to <i>Rhizobia</i> Inoculation, Nutrient Management and Sowing Dates in Nigeria Southern Guinea Savannah. |
| Borno State     | Faruk Galadanchi Umar      | M      | Response of Groundnut Varieties to <i>Rhizobia</i> Inoculation in The Sudan And Northern Guinea Savannas of Nigeria.  |
| Borno State     | Binta Ali Zongoma          | F      | Impact of Improved Cowpea Technology on Women Farmers in Southern Part of Borno State, Nigeria.   |
| Rwanda          | Rurangwa Eduard            | M      | Improving nitrogen fixation in common beans and soyabean in Rwanda.   |
| Tanzania        | Eliakira Kisetu Nassary    | M      | Intensification of maize-bean cropping systems in Northern Tanzania.  |
| The Netherlands | Ilse de Jager              | F      | Agriculture and nutrition linkage in N2Africa.  |
| The Netherlands | Esther Ronner              | F      | Impact of sustainable intensification of agricultural production through legume technologies on smallholder farming systems in Sub-Saharan Africa.  |
| The Netherlands | Wytze Marinus              | M      | Using the NUANCES approach to examine benefits of legumes in farming systems of East Africa   |
| Uganda          | Allan Ochieng              | M      | Understanding the need for inoculation of common bean in Uganda.  |

M= male, F= female

**Table 23. Overview of MSc students involved in N2Africa Phase II.**

| Country | Name           | Gender | Research topic  |
|---------|----------------|--------|---|
| France  | Ugo Verlingue  | M      | Guiding varietal choice for soyabean in Africa: A comparison of bottom-up and top-down modelling approaches to assess water limited potential yields. |
| Ghana   | Kennedy Ahlija | M      | Response of soyabean to rhizobial inoculation and nitrogen management in the Guinea Savanna zone of Ghana.  |
| Ghana   | Wuni Mawia     | M      | Effect of genotype and plant population on growth, N-fixation and yield of soyabean in Northern Guinea  |

|                 |                           |   |   |
|-----------------|---------------------------|---|---|
|                 |                           |   | Savanna zone of Ghana.  |
| Ghana           | Gifty Kuma                | F | Effect of genotype and plant population on growth, N-fixation and yield of soyabean in southern Guinea Savanna Zone of Ghana.   |
| Ghana           | Kuma Florence<br>Jessicah | F | Influence of P source on growth, nodulation and nitrogen fixation by different soyabean genotypes in two acid soils in northern Ghana.  |
| Ghana           | Godfrey Wilson            | M | Bio-prospecting for effective rhizobia isolates for groundnut and cowpea production in northern Ghana.  |
| Ghana           | Kwasi Gyan                | M | Market research.  |
| Ghana           | Ibrahim Issifu            | M | Effect of liming, phosphorus application and rhizobial inoculation on growth, N-fixation and yield of soyabean.   |
| Ghana           | Abdul Rahaman Karim       | M | Effect of farmers' storage practices on soyabean seed viability, vigour and germination.  |
| Kenya           | Martin Kiagayu Koinange   | M | Influence of biochar amendment on the effectiveness of elite Kenyan rhizobia nodulating common bean ( <i>Phaseolus vulgaris</i> L.).  |
| Kenya           | Wycliffe W. Waswa         | M | Evaluation of yield potential and management practices affecting soyabean production in western Kenya.  |
| Malawi          | Donald Siyeni             | M | Effect of rhizobia inoculation and phosphorus fertilizer on nodulation and yield of soyabean ( <i>Glycine max</i> (L.) Merrill) in Dedza, Kasungu and Salima districts of Malawi. |
| Nigeria         | Ngwu Chuwudi Hillary      | M | Genotype X Environment Interaction and Stability Analysis for Yield and Its Components In 24 Lines of Soyabean ( <i>Glycine Max</i> ) in Three Agro Ecological Zones of Nigeria.  |

<sup>1</sup> Student having collaborative research or internship with N2Africa

## Appendix III – List of project reports

1. N2Africa Steering Committee Terms of Reference
2. Policy on advanced training grants
3. Rhizobia Strain Isolation and Characterisation Protocol
4. Detailed country-by-country access plan for P and other agro-minerals
5. Workshop Report: Training of Master Trainers on Legume and Inoculant Technologies (Kisumu Hotel, Kisumu, Kenya 24-28 May 2010)
6. Plans for interaction with the Tropical Legumes II project (TLII) and for seed increase on a country-by-country basis
7. Implementation Plan for collaboration between N2Africa and the Soil Health and Market Access Programs of the Alliance for a Green Revolution in Africa (AGRA) plan
8. General approaches and country specific dissemination plans
9. Selected soyabeans, common beans, cowpeas and groundnuts varieties with proven high BNF potential and sufficient seed availability in target impact zones of N2Africa Project
10. Project launch and workshop report
11. Advancing technical skills in rhizobiology: training report
12. Characterisation of the impact zones and mandate areas in the N2Africa project
13. Production and use of rhizobial inoculants in Africa
18. Adaptive research in N2Africa impact zones: Principles, guidelines and implemented research campaigns
19. Quality assurance (QA) protocols based on African capacities and international existing standards developed
20. Collection and maintenance of elite rhizobial strains
21. MSc and PhD status report
22. Production of seed for local distribution by farming communities engaged in the project
23. A report documenting the involvement of women in at least 50% of all farmer-related activities
24. Participatory development of indicators for monitoring and evaluating progress with project activities and their impact
25. Suitable multi-purpose forage and tree legumes for intensive smallholder meat and dairy industries in East and Central Africa N2Africa mandate areas
26. A revised manual for rhizobium methods and standard protocols available on the project website
27. Update on Inoculant production by cooperating laboratories
28. Legume Seed Acquired for Dissemination in the Project Impact Zones
29. Advanced technical skills in rhizobiology: East and Central African, West African and South African Hub
30. Memoranda of Understanding are formalized with key partners along the legume value chains in the impact zones
31. Existing rhizobiology laboratories upgraded
32. N2Africa Baseline report
33. N2Africa Annual country reports 2011
34. Facilitating large-scale dissemination of Biological Nitrogen Fixation

35. Dissemination tools produced
36. Linking legume farmers to markets
37. The role of AGRA and other partners in the project defined and co-funding/financing options for scale-up of inoculum (banks, AGRA, industry) identified
38. Progress Towards Achieving the Vision of Success of N2Africa
39. Quantifying the impact of the N2Africa project on Biological Nitrogen Fixation
40. Training agro-dealers in accessing, managing and distributing information on inoculant use
41. Opportunities for N2Africa in Ethiopia
42. N2Africa Project Progress Report Month 30
43. Review & Planning meeting Zimbabwe
44. Howard G. Buffett Foundation – N2Africa June 2012 Interim Report
45. Number of Extension Events Organized per Season per Country
46. N2Africa narrative reports Month 30
47. Background information on agronomy, farming systems and ongoing projects on grain legumes in Uganda
48. Opportunities for N2Africa in Tanzania
49. Background information on agronomy, farming systems and ongoing projects on grain legumes in Ethiopia
50. Special Events on the Role of Legumes in Household Nutrition and Value-Added Processing
51. Value chain analyses of grain legumes in N2Africa: Kenya, Rwanda, eastern DRC, Ghana, Nigeria, Mozambique, Malawi and Zimbabwe
52. Background information on agronomy, farming systems and ongoing projects on grain legumes in Tanzania
53. Nutritional benefits of legume consumption at household level in rural sub-Saharan Africa: Literature study
54. N2Africa Project Progress Report Month 42
55. Market Analysis of Inoculant Production and Use
56. Identified soyabean, common bean, cowpea and groundnut varieties with high Biological Nitrogen Fixation potential identified in N2Africa impact zones
57. A N2Africa universal logo representing inoculant quality assurance
58. M&E Workstream report
59. Improving legume inoculants and developing strategic alliances for their advancement
60. Rhizobium collection, testing and the identification of candidate elite strains
61. Evaluation of the progress made towards achieving the Vision of Success in N2Africa
62. Policy recommendation related to inoculant regulation and cross border trade
63. Satellite sites and activities in the impact zones of the N2Africa project
64. Linking communities to legume processing initiatives
65. Special events on the role of legumes in household nutrition and value-added processing
66. Media Events in the N2Africa project
67. Launch N2Africa Phase II – Report Uganda

68. Review of conditioning factors and constraints to legume adoption and their management in Phase II of N2Africa
69. Report on the milestones in the Supplementary N2Africa grant
70. N2Africa Phase II Launch in Tanzania
71. N2Africa Phase II 6-months report
72. Involvement of women in at least 50% of all farmer related activities
73. N2Africa Final Report of the First Phase: 2009-2013
74. Managing factors that affect the adoption of grain legumes in Uganda in the N2Africa project
75. Managing factors that affect the adoption of grain legumes in Ethiopia in the N2Africa project
76. Managing factors that affect the adoption of grain legumes in Tanzania in the N2Africa project
77. N2Africa Action Areas in Ethiopia, Ghana, Nigeria, Tanzania and Uganda in 2014
78. N2Africa Annual Report Phase II Year 1
79. N2Africa: Taking Stock and Moving Forward. Workshop report
80. N2Africa Kenya Country Report 2015
81. N2Africa Annual Report 2015
82. Value Chain Analysis of Grain Legumes in Borno State, Nigeria
83. Baseline report Borno State
84. N2Africa Annual Report 2015 DR Congo
85. N2Africa Annual Report 2015 Rwanda
86. N2Africa Annual Report 2015 Malawi
87. Contract Sprayer in Borno State, Nigeria
88. N2Africa Baseline Report II Ethiopia, Tanzania, Uganda, version 2.1
89. N2Africa rhizobial isolates in Kenya
90. N2Africa Early Impact Survey, Rwanda
91. N2Africa Early Impact Survey, Ghana
92. Tracing seed diffusion from introduced legume seeds through N2Africa demonstration trials and seed-input packages
93. The role of legumes in sustainable intensification – priority areas for research in northern Ghana
94. The role of legumes in sustainable intensification – priority areas for research in western Kenya
95. N2Africa Early Impact Survey, Phase I
96. Legumes in sustainable intensification – case study report PROIntensAfrica
97. N2Africa Annual report 2016

## Partners involved in the N2Africa project
